## **Gene expression profiling (GEP)**

### **Nanostring**

400ng (10 $\mu$ l at 40ng/ $\mu$ l) of total RNA from FFPE samples were processed using Gene Expression Lymph2Cx NanoString Assay. Samples were then incubated in a PCR machine, for 16 hours at 67°C. Next morning, on the deck of the NanoString nCounter Prep Station, purified Target/Probe complexes are eluted off and are immobilized in the cartridge for data collection on the nCounter Digital Analyzer. Digital images are processed on the nCounter Digital Analyzer and the barcode counts are tabulated in a comma separated value (CSV) format, which can be downloaded via a memory stick. Analysis was performed using nSolver 2.5 software.

### **HTG**

Next generation sequencing (NGS)-based gene expression profiling (GEP) was done to classify the DLBCL samples into GCB, ABC or unclassifiable subtypes using the HTG EdgeSeq System (HTG Molecular Diagnostics Inc., Tucson, AZ, USA). HTG gene expression data was generated using the HTG EdgeSeq DLBCL Cell of Origin Assay IT for Ion Torrent platform (Ion GeneStudio S5 prime, Thermo Fisher Scientific, Waltham, MA, USA). Starting material was tissue sections using 5  $\mu$ m formalin-fixed paraffin embedded (FFPE) sections according to the manufactures protocol. Target capture, final libraries and semiconductor sequencing were performed with KAPA Library Quantification Kit, the Ion 510 & Ion 520 & Ion 530 Kit – Chef and the Ion 520 Chip Kit (Thermo Fisher Scientific, Waltham, MA, USA) according to the HTG recommendations, prepared for sequencing for Ion Torrent platform (F. Hoffman - La Roche AG, Basel/Kaiseraugst, Switzerland). The HTG EdgeSeq DLBCL panel measures the expression of 92 genes associated to B-cell lymphomas. The COO classification was performed using the HTG Edge System software (Version 5.5.823.5747). The HTG algorithm is trained to minimise the unclassifiable subgroup when compared with other methods <sup>1</sup>.

## **Mutational analysis - targeted Next Generation Sequencing**

### **SureSelectXT approach**

A total of 46 FFPE DNA samples were processed using SureSelectXT (Agilent Technologies, Santa Clara, CA) and using a panel design described in Supplemental Table 1. A total of 100ng of genomic DNA was sheared using the Covaris S220 focused-ultra sonicator (Covaris, Woburn, MA) to a target peak size of 150–200 bp. Library preparation were performed using SureSelectXT Custom Capture Library baits as described in SureSelectXT Target Enrichment System protocol (Agilent Technologies inc). For amplification of the post capture libraries, 10

to 13 cycles were performed depending on the initial sample quality. The libraries were qualified using the Bioanalyzer HS (Agilent Technologies inc.), quantified with the KAPA Library Quantification Kit (Kapa Biosystems, Wilmington, Massachusetts) and sequenced in a MiSeq instrument (Illumina, San Diego, CA) in a paired-end run of 150 bp. The average sequencing coverage of the 46 cases across regions was 873x (range 26-2693x).

FASTQ files were generated by MiSeq control software and quality control of the raw data was performed using the FastQC tool. Sequencing reads were subsequently aligned to the human reference genome (GRCh37/hg19) using the Burrows-Wheeler Aligner-MEM algorithm<sup>2</sup>. Variant calling was performed using two different variant callers, Somatic Variant Caller (Illumina inc.) and Mutect2 (Genome Analysis Toolkit-GATK version 4.0.3)<sup>3</sup> and annotated using the VariantStudio software v3.0 and ANNOVAR, respectively.<sup>4</sup> Quality calls were excluded. For Mutect2 variants, low quality variants were also excluded using FilterMutectCalls (GATK) with default thresholds. We excluded non-interrogated variants (non-exonic) and known polymorphisms described in the GenomeAD, 1000Genomes and/or ExAC database (release 2015) with more than 1% frequency and synonymous variants. Finally, each variant was also visually inspected with the Integrative Genomics Viewer (IGV, Broad Institute, version 2.3) software to exclude artifacts.

### **AmpliSeq approach**

Targeted mutation analysis was performed by Next Generation Sequencing (Ion GeneStudio S5 prime, Thermo Fisher Scientific) using an AmpliSeq Custom Panel designed for DLBCLs (Supplemental Table 2). Amplicon library preparation and semiconductor sequencing was done according to the manufacturers' manuals using the Ion AmpliSeq Library Kit v2.0, the Ion Library TaqMan Quantitation Kit, the Ion 510 & Ion 520 & Ion 530 Kit – Chef, the Ion 520 Chip Kit and the Ion 530 Chip Kit (Thermo Fisher Scientific) as described before.<sup>5</sup>

Variant calling of non-synonymous somatic variants compared to the human reference sequence was performed using Ion Reporter Software (Thermo Fisher Scientific, Version 5.10.1 to Version 5.16.0.2). Variants were filtered with a threshold allele frequency of 5%. Variants called by the Ion Reporter Software were visualized using the Integrative Genomics Viewer (IGV; Broad Institute, Cambridge, MA; Version 2.8.0) to exclude panel-specific artefacts.

### **Prediction of mutation effect**

Since no germline DNA was available and in order to select somatic variants, potential driver mutations were predicted according to previously published criteria in which the 90% of the

mutations classified as functional were demonstrated to be somatic.<sup>6</sup> Inclusion criteria were: 1) any variant described previously as somatic or functional on previous reports or COSMIC, 2) all truncating variants (nonsense, frameshift, splice donor or acceptor mutations; and 3) the remaining missense variants that were predicted to be functionally deleterious using Mutation Assessor<sup>7</sup> or SIFT predictor (<http://sift.jcvi.org/>) if a definitive score was not provided by Mutation Assessor.<sup>8</sup>

### DNA copy number (CN) alterations analysis

CN regions of alteration with minimum size of 100 kb and CNN-LOH larger than 5 Mb were considered informative. Physiological deletions of the immunoglobulin loci were excluded from the analysis (Supplemental Table 7).

### Statistical methods

Differences in the distribution of individual parameters among patient subsets were analyzed by Fisher's exact test for categorized variables, and the Student's t-test for continuous variables (Supplemental Methods). Only mutations and genomic aberrations present in 5% of the cases and affecting a minimum of four cases were accounted for comparisons. The *P*-values for multiple comparisons were adjusted using the Benjamini–Hochberg correction (false discovery rate, FDR). A cut-off of *P*=.05 was considered significant. Statistical analyses were performed using R software v3.5.0.

Survival probabilities were estimated with the Kaplan–Meier method and differences assessed by the log-rank test. Event free survival (EFS) was calculated as previously described.<sup>24</sup>

Case 25 has in addition a *BCL2* rearrangement

Case 26 has in addition a *BCL2* and a *BCL6* rearrangement

Supplemental Figure 1: Control group

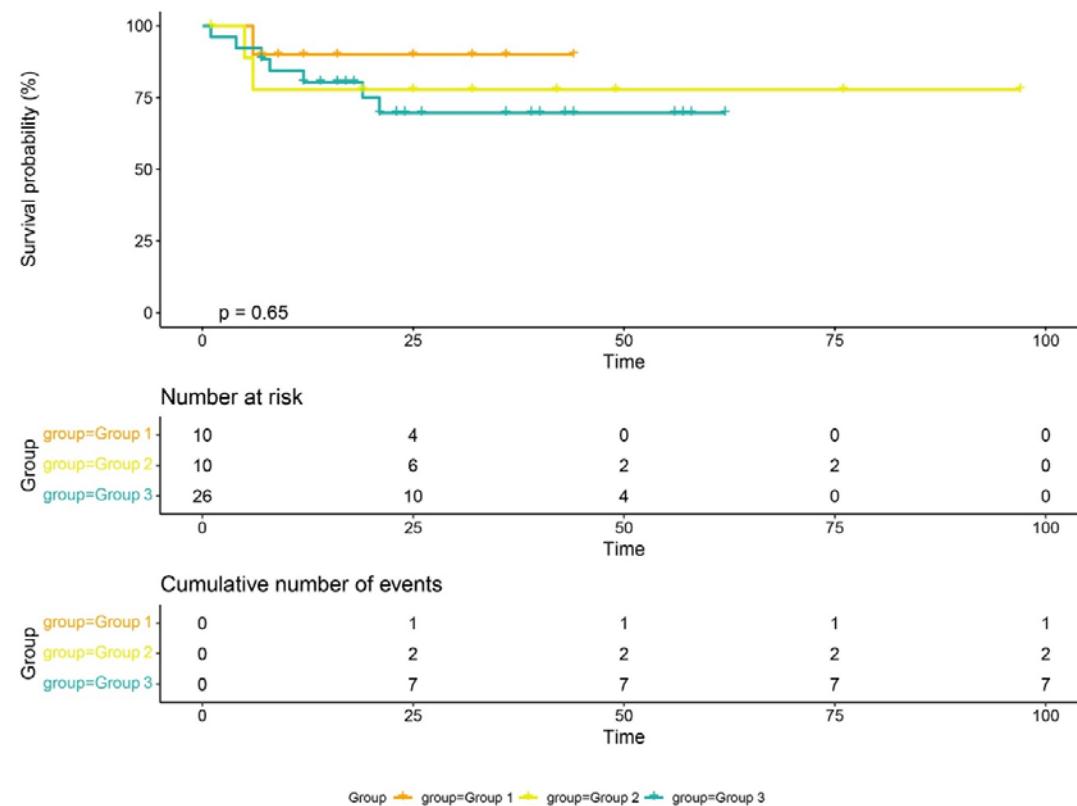

Case	Age at diagnosis	Localization	Type Hans	Mutations	GEP	FISH
					COO*	
CoGCB1	71	spleen	GCB	<i>PIM1, TNFAIP3, EZH2</i>	GCB	None
CoGCB2	76	LN cervical	GCB	<i>BCL2</i>	GCB	<i>BCL2</i>
CoGCB3	74	acromion	GCB	<i>BCL2</i>	GCB	<i>BCL2</i>
CoGCB4	64	LN cervical	GCB	<i>BCL2, EZH2</i>	GCB	<i>BCL2, MYC</i>
CoGCB5	68	LN cervical	GCB	<i>BCL2</i>	GCB	<i>MYC</i>
CoABC1	77	testis	ABC	<i>MYD88, CARD11, PIM1</i>	ABC	None
CoABC2	76	testis	ABC	<i>MYD88, PIM1</i>	ABC	None
CoABC3	74	ENT	ABC	<i>MYD88, PRDM1, PIM1</i>	ABC	None
CoABC4	87	LN cervical	ABC	<i>MYD88, CD79B</i>	ABC	None

GEP: gene expression profile, FISH fluorescence in situ hybridization; GCB: germinal center B-cell; ABC: Activated B-cell; COO: cell of origin Co: Control.

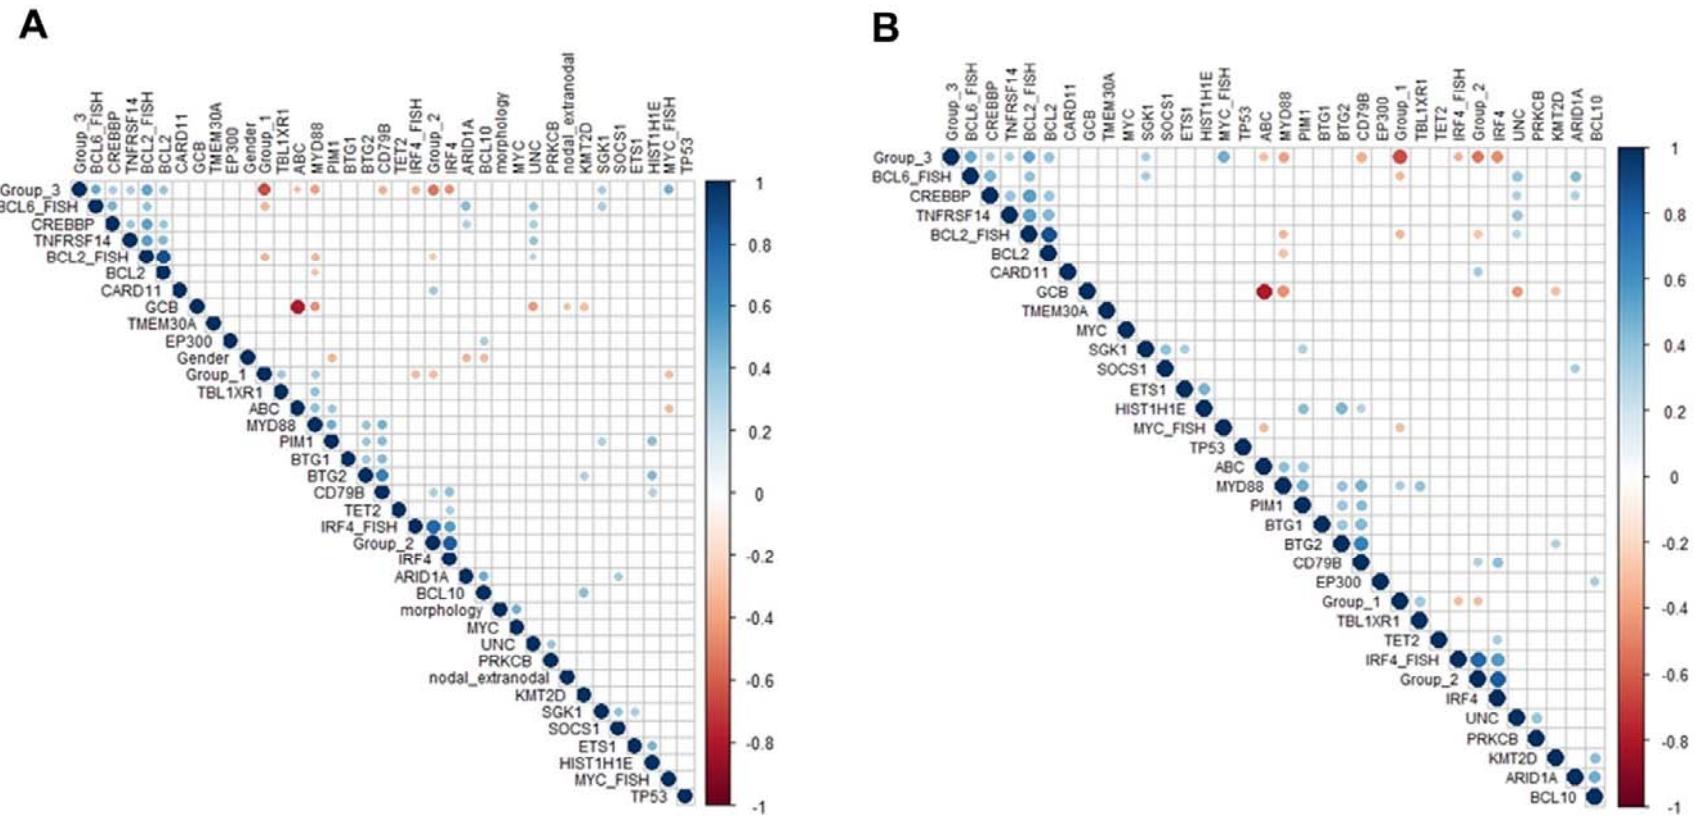

### Supplemental Figure 2. Overall survival analysis of 46 cases of DLBCL-AE.

Survival analysis (Kaplan Meier estimator) of 46 cases of DLBCL-AE divided by FISH group 1-3. The difference in the overall survival is not significant ( $P=0.065$ ). Below, the risk table with patients at risk and cumulative events per group. Group 1, DLBCL-AE without rearrangements, Group 2, DLBCL-AE-*IRF4* and Group 3: DLBCL-AE with *BCL2/BCL6/MYC/IGH* rearrangements. Survival analysis and plotting was performed with R version 4.0.5 (R Core Team, 2021) using Survminer package (Kassambara A., 2021)

**Supplemental Figure 3. Correlation analysis of clinical and/or molecular features in 50 cases of DLBCL-AE**

**A)** Correlation analysis including cluster groups, clinical and pathological features (age, male gender, morphology, extranodal involvement), COO, genetic rearrangements and mutations in more than 4 cases. **B)** Correlation analysis including cluster groups, COO, genetic rearrangements and mutations in more than 4 cases.
