Supplementary Figure 4: Flow Cytometry Analysis of Head and Neck Cancer Cell Line Panel, Lewis B	p. 6
Supplementary Figure 5: Parameters for Mass Spectrometry Data Analysis (Proteome Discoverer/Byonic.....	p. 7
Supplementary Figure 6: MS2 Spectrum of EGFR Site N389 EGFR Glycopeptide from HSC-3 Cells.....	p. 8

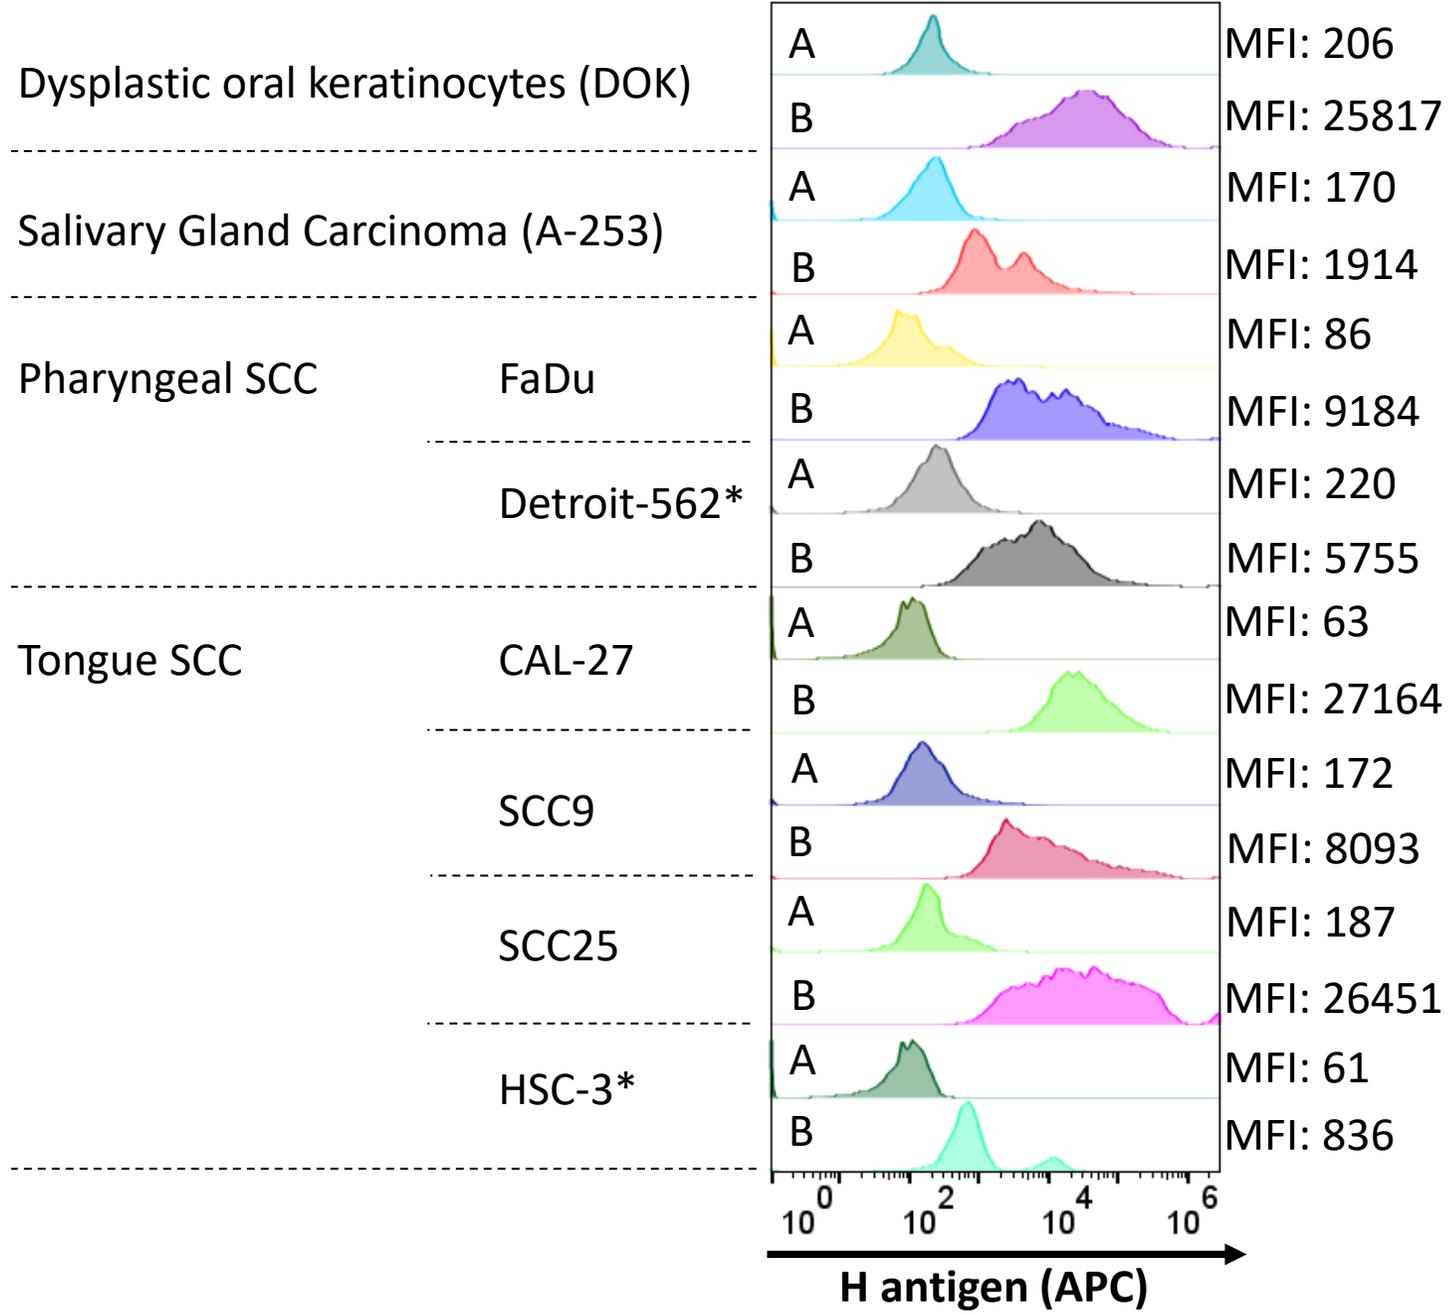

Supplementary Figure 1 : Kaplan-Meier Survival Analysis Indicates that FUT1 Expression is not Associated with Survival in Head and Neck Cancer. P-values of <0.05 were considered to be statistically significant. The study group consisted of all patient primary tumor tissue data from the Head and Neck Cancer dataset found on The Cancer Genome Atlas Genomic Data Commons database version 18.0 ($n=499$). The median mRNA gene expression was utilized as the cutoff to denote high and low gene expression, quantified using HTseq and reported in fragments per kilobase of transcript per million mapped reads (FPKM). To compliment the findings, multivariate Cox regression analysis was conducted which also found that FUT1 gene expression was not an independent predictor of survival (HR = 1.094 (95% CI 0.829-1.445)), $p = 5.25 \times 10^{-1}$).
