

Supplemental Figure 2

**Supplemental Figure 2. Co-administration of Alb-IFN β and OVA leads to enhanced OVA specific IgG2A antibody response.**

To detect mouse anti-OVA IgG1 or IgG2A antibodies in vaccinated mice, an ELISA assay was performed. Sera from vaccinated and untreated mice were collected on day 25. **(A)** Schematic illustration of the experiment (same as in **Figure 2**). Sera from naïve mice served as negative control. The sera were diluted 1000 \times fold. **(B)** ELISA results of IgG1 antibodies. **(C)** ELISA results of IgG2A antibodies. * p <0.05, ** p <0.01, *** p <0.001, **** p < 0.0001, ns not significant.
