

Supplementary Material

Supplementary Figure 1. Antiviral T cells against SARS-CoV-2 wild type (WT) and variants of concern (VOC) in convalescent COVID-19 patients. PBMCs obtained at the time of donor pre-testing (pre-vaccination) and PBMCs isolated from recently collected samples (post-vaccination) were analyzed via Interferon-gamma (IFN- γ) Enzyme-Linked ImmunoSpot (ELISpot) assay using peptide pools covering the Spike (S) protein from WT and different VOCs as well as membrane (M) and nucleoprotein (N). Data are shown as mean+SD. spw: spots per well.
