

Supplemental Figures:

Supplemental Figure 1. SARS-CoV-2 spike protein is no longer detectable via immunohistochemistry 14 days post-AZD1222 immunization

Muscle injection sites, spleen and bone marrow were evaluated 14 days post AZD1222 immunization by hematoxylin and eosin and immunohistochemistry. HEK293x cells transduced with AZD1222 were used as positive controls for bone marrow and splenic analyses due to negative injection site staining. Scale bar represents 200 μ m.

H&E, Hematoxylin and eosin; IHC, immunohistochemistry.
