Quantitative RT-PCR

Supplemental Figure Legends

Supplemental Figure 1. Short interfering RNA-mediated knockdown of AhR. (A) Quantitative RT-PCR of RNA from KCs after transfection with control (ctrl) or AhR targeting (AhR) siRNAs. (B) Immunoblot of AhR following transfection of siRNAs.

Supplemental Figure 2. AhR mediates PGN-induced inflammation in human primary keratinocytes. Quantitative RT-PCR after KCs were stimulated by PGN (20 µg/ml) for 3 h. (a) Cells were pretreated with CH223191 (10 µM) or vehicle for 1 h or (b) transfected with a control siRNA or an AHR-specific siRNA. For both experiments, n=3; two-sided t-test with error bars = SEM; * $p < 0.05$, ** $p < 0.01$; ns= not significant.

Supplemental Figure 3. Effect of AhR on transcriptional expression of AP-1 family members after PGN stimulation. Quantitative RT-PCR after KCs were stimulated by PGN (20 µg/ml) for 3 h. (a) Cells were pretreated with CH223191 (10 µM) or vehicle for 1 h or (b) transfected with a control siRNA or an AHR-specific siRNA. For both experiments, n=3; two-sided t-test with error bars = SEM; ns= not significant.

Supplemental Table (following pages). Differentially expressed genes identified by RNA-sequencing of Control vs. PGN-treated keratinocytes, Control vs. AHR-knockdown keratinocytes, and Control+PGN vs. AHR-knockdown+PGN keratinocytes. Differentially expressed genes were defined as those displaying an expression difference >1.5-fold, p-value <0.05 based on two-sided t-test, and minimum threshold of 5 read counts. Expression differences are displayed as a log₂ fold change values.
