

Supplementary Table 1. Number of COVID-19 patients with anti-IFN- ω neutralizing antibodies (NAB, %) stratified according to anti-IFN- α 2 NAB titer, gender, and clinical parameters

| Patients stratified according to anti-IFN- α 2 NAB titer (%) (n=13) | Number of anti-IFN- ω NAB patients (%) | Number of anti-IFN- ω NAB male patients (%) * | Number of anti-IFN- ω NAB patients admitted to ICU (%) ** | Number of anti-IFN- ω NAB patients with fatal outcome (%) *** |
|--|---|--|--|--|
| 3/13 (23) (Low: < 1000, range 500 – 13 TRU/ml) | 1/3 (33.3) | 1/1 (100) | 0/1 (0) | 0/1 (0) |
| 4/13 (30.8) (Intermediate: \geq 1000, range 8533 – 5688 TRU/ml) | 2/4 (50) | 1/2 (50) | 1/2 (50) | 1/2 (50) |
| 6/13 (46.1) (High: \geq 10.000, range 34133 – 10666 TRU/ml) | 6/6 (100) | 6/6 (100) | 6/6 (100) | 6/6 (100) |

Data are expressed as proportion of COVID-19 patients with anti-IFN- α 2 or IFN- ω NAB (%). Statistical analysis was performed using Fisher's exact test or Yates Chi-square. *Male sex association: **p=0.0034** [anti-IFN- ω NAB male patients (8/9) vs anti-IFN- ω NAB female patient (1/9)]; **ICU admission: **p<0.0001** [anti-IFN-I BAB negative patients (42/299) vs anti-IFN- ω NAB positive patients (7/9)]; ***Death rate: **p<0.0001** [anti-IFN-I BAB negative patients (32/299) vs anti-IFN- ω NAB positive patients (7/9)].

Supplementary Table 2. Anti-IFN-I neutralizing antibodies (NAB) in samples collected from the respiratory tract of COVID-19 patients

| Patients No. | Sex | Age (years) | Respiratory sample | Days of hospitalization | Clinical characteristics | NAB to IFN- α 2 (TRU/ml, serum samples) | NAB to IFN- α 2 (TRU/ml, respiratory samples) | NAB to IFN- α 1* (TRU/ml, respiratory samples) | NAB to IFN- ω (TRU/ml, respiratory samples) | NAB to IFN- β (TRU/ml, respiratory samples) |
|--------------|-----|-------------|--------------------|-------------------------|--------------------------|--|--|---|--|---|
| 14 | M | 79 | BAL | 72 | ICU | <10 | <10 | <10 | <10 | <10 |
| 15 | M | 69 | BAL | 15 | ICU | <10 | <10 | <10 | <10 | <10 |
| 16 | F | 76 | BAL | 12 | ICU, dead | <10 | <10 | <10 | <10 | <10 |
| 17 | M | 73 | BAL | 1 | ICU, dead | <10 | <10 | <10 | <10 | <10 |
| 18 | F | 63 | BAL | NA | ICU, dead | <10 | <10 | <10 | <10 | <10 |
| 19 | M | 38 | BAL | 65 | ICU, ECMO, dead | <10 | <10 | <10 | <10 | <10 |
| 20 | M | 67 | BAL | 60 | ICU, dead | <10 | <10 | <10 | <10 | <10 |
| 21 | M | 80 | BAL | 91 | VMK, CPAP | <10 | <10 | <10 | <10 | <10 |

| 28 | F | 62 | NPS | NA | NA | <10 | <10 | <10 | <10 | <10 |
| 29 | M | 52 | NPS | 20 | NA | <10 | <10 | <10 | <10 | <10 |

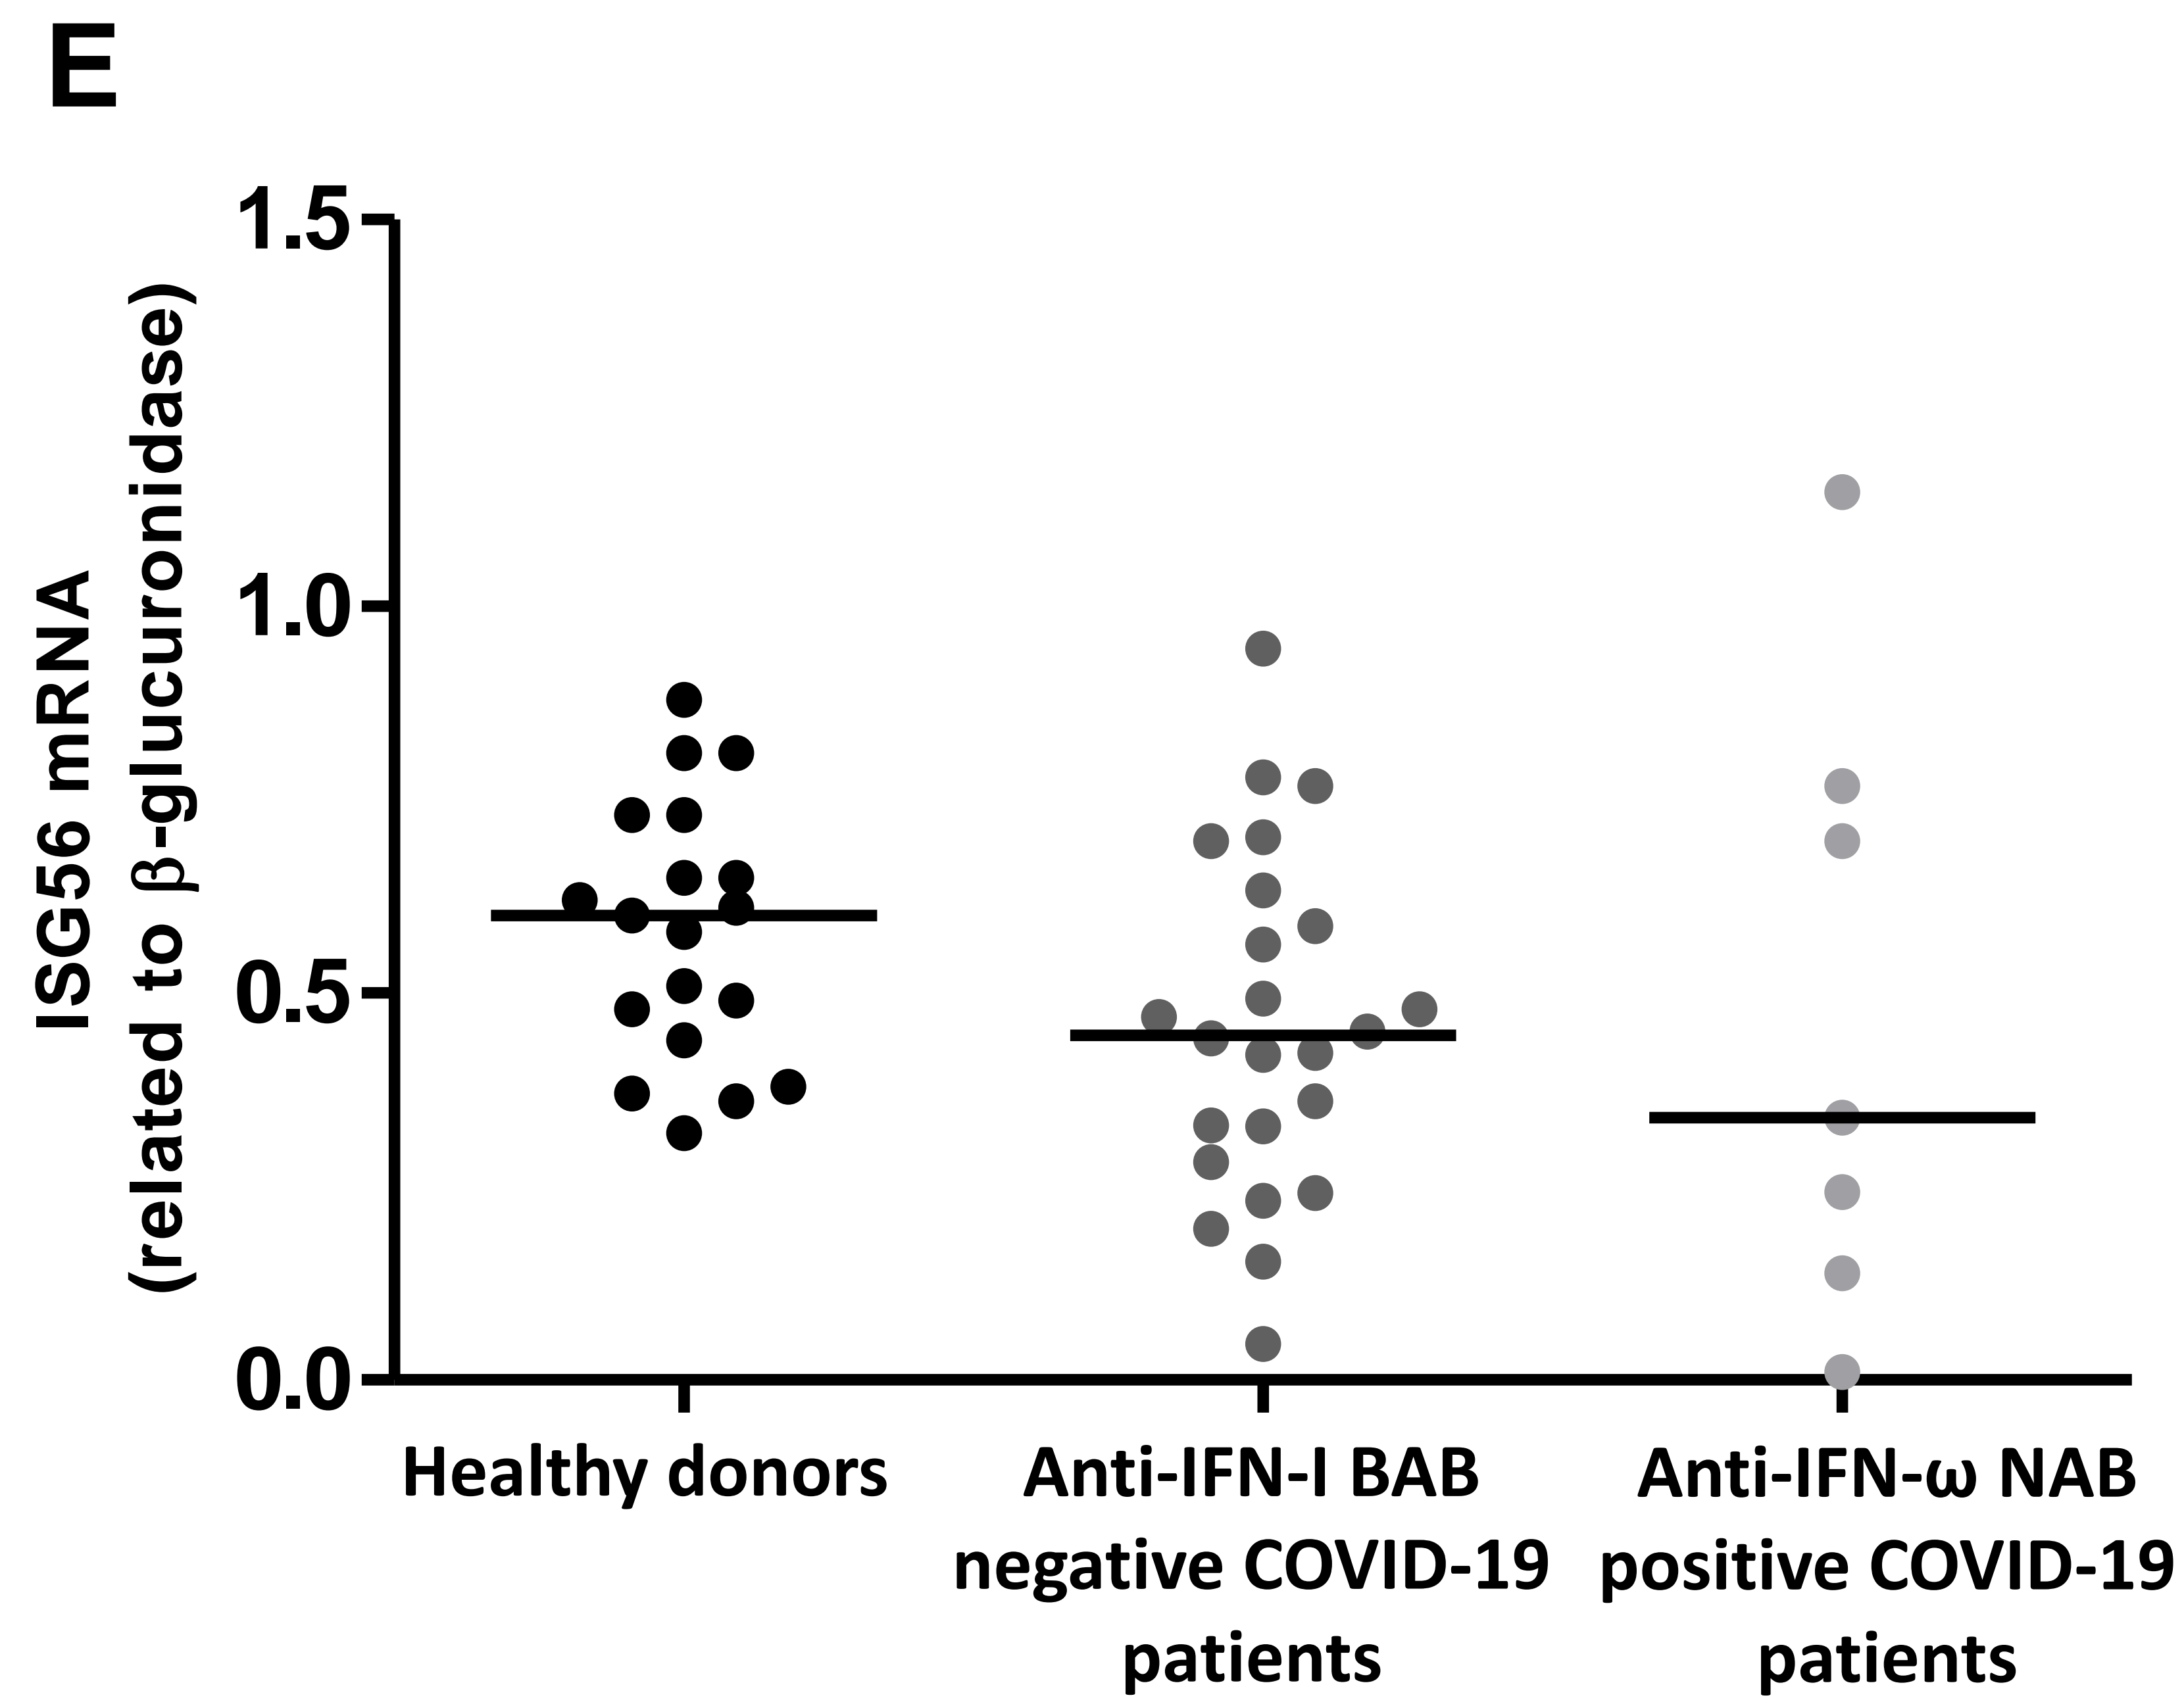

Clinical characteristics were available of 14 out of 17 COVID-19 patients. NAB positive samples are in bold. IFN- α 1* = is referred to IFN- α subtypes contained in the natural IFN- α preparation. ICU= intensive care unit; ECMO= extracorporeal membrane oxygenation; VMK= venturi mask; CPAP= continuous positive airway pressure; IHD= ischemic heart disease; DVT= deep vein thrombosis; BAL=bronchoalveolar lavage; NPS=nasopharyngeal swab; NA=not available.

Supplementary Figure 1

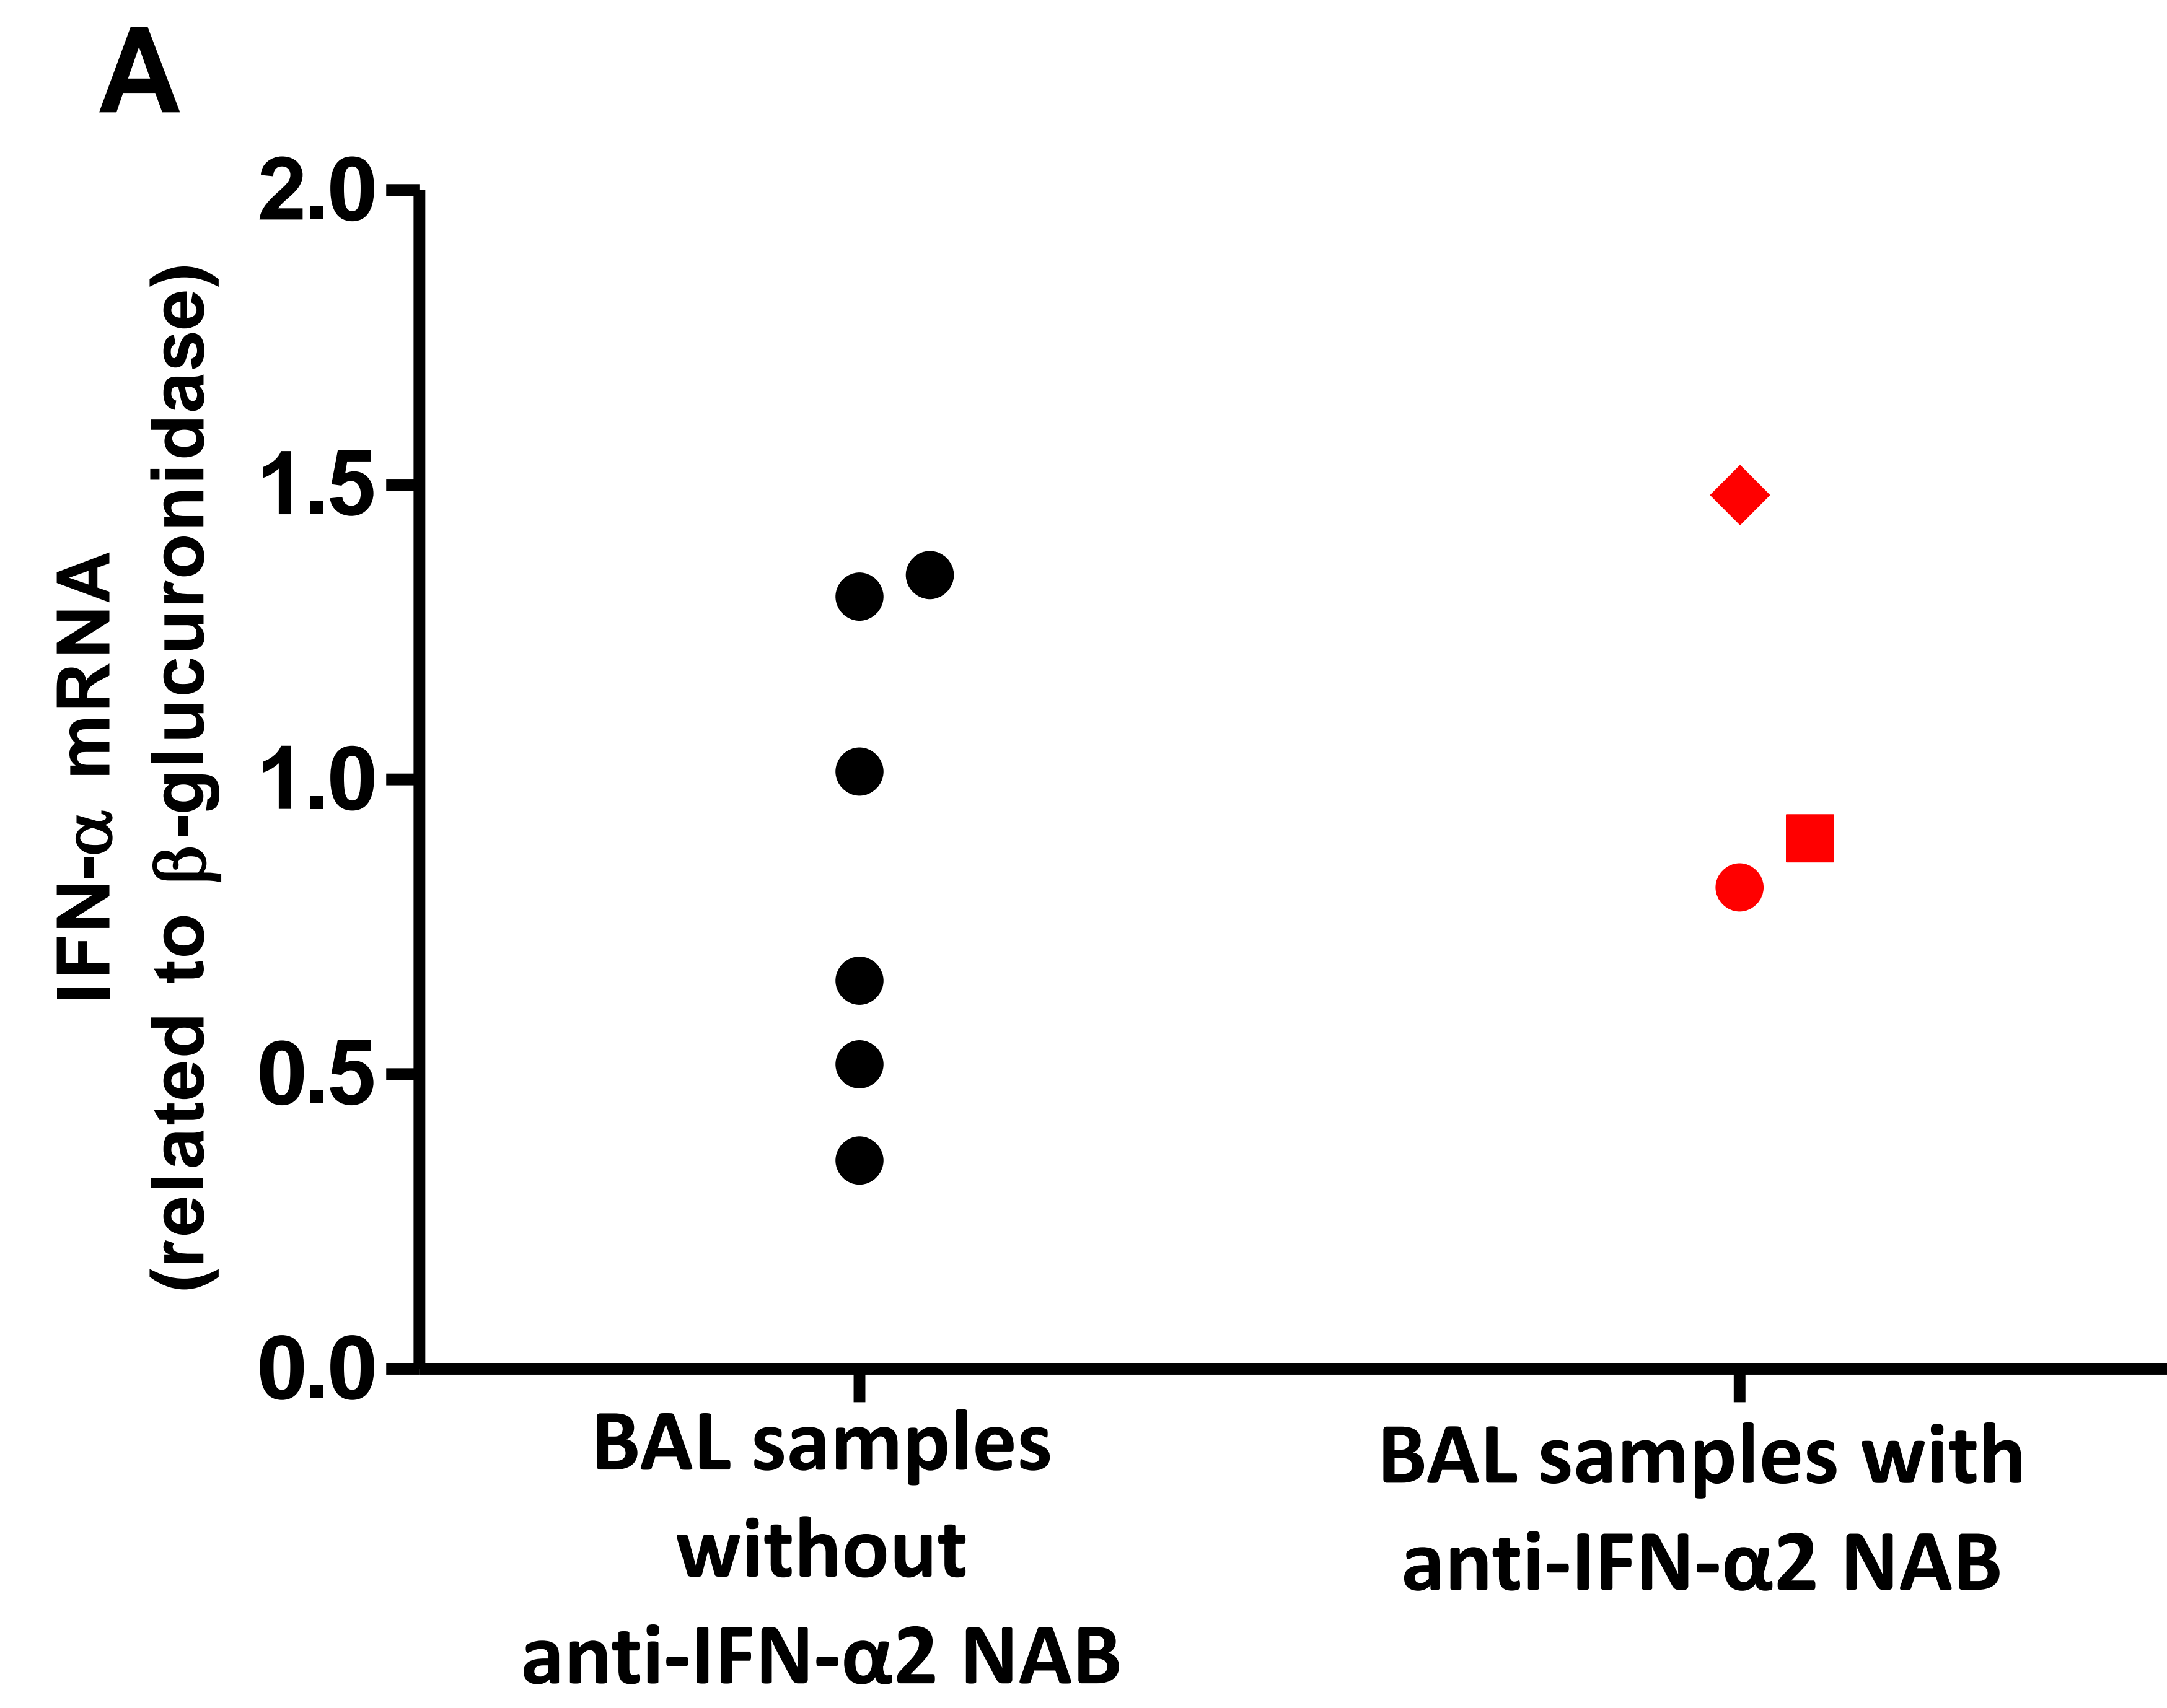

Supplementary Figure 1. Anti-IFN- ω NAB were associated with laboratory biomarkers predictive for COVID-19 outcome. Biochemical and hematological parameters measured in SARS-CoV-2 infected patients, stratified by auto-antibody status as anti-IFN-I BAB negative patients (n=299), anti-IFN- α/β BAB positive patients without NAB to IFN- α subtypes, IFN- β and IFN- ω (n=48), and anti-IFN- ω NAB positive patients (n=9). CRP= C-reactive protein (Panel A); LDH= lactate dehydrogenase (Panel B); D-Dimer (Panel C); WBC= white blood cells (Panel D); neutrophils (Panel E); platelets (Panel F); NLR= neutrophils to lymphocytes ratio (Panel G); PLR=platelets to lymphocytes ratio (Panel H); lymphocytes (Panel I); monocytes (Panel L); Median values of biochemical and hematological parameters are reported, for each group of study, with a red horizontal line. Female patients are represented with open circle symbols while male patients with close circle symbols. *p<0.05; **p<0.01; ***p \leq 0.001. Values of biochemical and hematological parameters were compared by Mann-Whitney test.

Supplementary Figure 2

Supplementary Figure 2. Expression levels of IFN-I and IFN stimulated genes (ISGs) in anti-IFN- ω NAB positive COVID-19 patients. Panels A-E represent expression levels of genes encoding IFN- α (Panel A), IFN- β (Panel B), IFN- ω (Panel C), ISG15 (Panel D) and ISG56 (Panel E) in PBMC collected from healthy donors (n=19), anti-IFN-I BAB negative COVID-19 patients (n=24), and those who developed anti-IFN- ω NAB (n=7). Gene expression data were available for 7 out of 9 patients with NAB to IFN- ω . Statistical analysis of transcript levels of IFNs and ISGs genes related to β -glucuronidase ($2^{-\Delta C_t}$) method was carried out using Mann-Whitney test. Median values of gene expression levels are reported, for each group of study, with a black horizontal line. *p <0.01; **p <0.001.

Supplementary Figure 3

- Pt.7 – anti-IFN- α 2 NAB (20 TRU/ml)
- Pt.22 – anti-IFN- α 2 NAB (15 TRU/ml)
- ◆ Pt.23 – anti-IFN- α 2 NAB (10 TRU/ml)

Supplementary Figure 3. Expression levels of IFN- α/β and IFN stimulated genes in respiratory samples of anti-IFN- α NAB positive COVID-19 patients. Expression levels of genes encoding IFN- α (Panel A), IFN- β (Panel B), ISG15 (Panel C) and ISG56 (Panel D) in bronchoalveolar lavage (BAL) collected from COVID-19 patients with (n=3, Pt 7, Pt 22 and Pt 23) or without anti-IFN- α 2 NAB (n=6). For each patient (Pt 7, Pt 22 and Pt 23) is indicated the NAB titer against IFN- α 2 subtype. Distinct red symbols (square, circle and rhombus) represent COVID-19 patients (n=3) with anti-IFN- α 2 NAB in BAL samples. IFN- β data were available for 5 out of 6 BAL samples without anti-IFN- α 2 NAB.
