

We transfected cervical cancer cells with KLF14-overexpressing lentivirus and its negative control lentivirus, and detected the expression level of KLF14 with KLF14 antibody(Sigma-Aldrich, HPA044729). The Lv-control group can be regarded as primitive cells and can represent endogenous levels of KLF14 expression. The Lv-KLF14 group was compared with the Lv-control group. The result is shown below.
