

Supplemental Figure 1. Box plots for serum klotho concentrations (pg/mL) by survey cycle. Mean and standard deviations for the klotho concentrations were: 847.1 (292) for 2007-2008; 844.6 (296) for 2009-2010; 886.1 (307) for 2011-2012; and 841.4 (258) for 2013-2014. Median serum klotho concentration was 810 pg/mL (IQR=318), but varied by survey cycle, with medians of 806 pg/mL (IQR=327) in 2007-2008, 792 pg/mL (IQR=326) in 2009-2010, 834 pg/mL (IQR=326) in 2011-2012, and 808 pg/mL (IQR=297) in 2013-2014. The middle line of the box represents the median value, with the edges of the box representing the 25th and 75th percentiles; the whiskers extend to 1.5×(interquartile range) and the dots represent values falling outside that range. P-value for differences determined by adjusted Wald F-test.

Supplemental Figure 2. Serum klotho concentrations by select participant characteristics. Scatter plots and linear fit lines for serum klotho concentrations by age, body mass index, eGFR, household income and alcohol consumption. Note: 20.5% of participants missing information on alcohol intake.

Supplemental Figure 3. Serum klotho concentrations by categorical participant characteristics. Box plots for serum klotho concentrations for sex, race/ethnicity, educational attainment, and smoking status. The middle line of the box represents the median value, with the edges of the box representing the 25th and 75th percentiles; the whiskers extend to 1.5×(interquartile range) and the dots represent values falling outside that range. P -value determined by Wald test using linear regression models that treat log-transformed klotho as the dependent variable and the participant characteristic as the independent variable.

Supplemental Table 1. Serum klotho concentrations by categorical participant characteristics.

| | Mean (SD) | Median (IQR) |
|--|-----------|--------------|
| Sex | | |
| Male | 835 (259) | 797 (299) |
| Female | 872 (291) | 822 (342) |
| Race | | |
| Non-Hispanic White | 846 (207) | 804 (308) |
| Hispanic | 869 (420) | 830 (320) |
| Non-Hispanic Black | 918 (588) | 843 (444) |
| Other | 860 (338) | 827 (319) |
| Educational attainment | | |
| High school degree/equivalency or less | 847 (311) | 805 (320) |
| Some college | 849 (269) | 803 (309) |
| College degree or more | 869 (234) | 822 (333) |
| Physical Activity | | |
| Does not meet guidelines | 854 (304) | 808 (331) |
| Meets guidelines | 855 (258) | 811 (311) |
| Smoking Status | | |
| Never | 874 (277) | 828 (331) |
| Former | 836 (264) | 800 (307) |
| Current | 831 (293) | 788 (316) |
| Mortality Status | | |
| Alive | 856 (273) | 811 (318) |
| Dead | 808 (348) | 759 (335) |

Abbreviations: interquartile range, IQR; standard deviation, SD

Supplemental Table 2. Hazard ratios and 95% confidence intervals for the association between serum klotho concentrations and all-cause mortality, before and after adjusting for alcohol consumption (n=8,001)

| | Age, Sex, survey cycle adjusted | | | Additional adjustment for alcohol | | |
|-------------------------------|---------------------------------|------------|----------|-----------------------------------|------------|----------|
| | HR | 95% CI | P-value | HR | 95% CI | P-value |
| Klotho concentration | | | | | | |

| Continuous, per 1-SD decrease | 1.12 | 1.00, 1.27 | 0.03 | 1.12 | 0.99, 1.27 | 0.06 |

Alcohol consumption missing from 20.5% of full study sample.

Differences in association estimates between this Table and Table 3 of the manuscript are potentially due to selection bias based on those with missing data. We find little change in association estimates across the two models presented in this table, suggesting that alcohol consumption does not confound the association between klotho and mortality.

Supplemental Table 3. Hazard ratios and 95% confidence intervals for the association between serum klotho concentrations and cause-specific mortality. (N= 10,069)

| | Heart disease mortality | | | Cancer mortality | | |
|-------------------------------|-------------------------|------------|----------|------------------|------------|----------|

Models adjusted for age, sex and survey cycle.

By the end of study follow-up, 104 (1.0%) participants died from heart disease and 177 (1.8%) died from cancer.

.

Supplemental Table 4. Hazard ratios (and 95% confidence intervals) for the association between klotho concentrations and all-cause mortality, stratified by participant characteristics.
