

Supplementary Fig. 1. Cross-sectional images reconstructed using two-photon microscopy. Macrophages were increased 3 days after noise exposure near the Crista basilaris area. (A) Pre-noise cochlea. (B) 1 day, (C) 3 days. (D) 5 days, (E) 7 days after noise exposure. Inner hair cell and outer hair cells were indicated by dotted lines. The white arrows indicate Crista basilaris.
