

**Supplemental information**

**CCL27 is a crucial regulator of immune  
homeostasis of the skin and mucosal tissues**

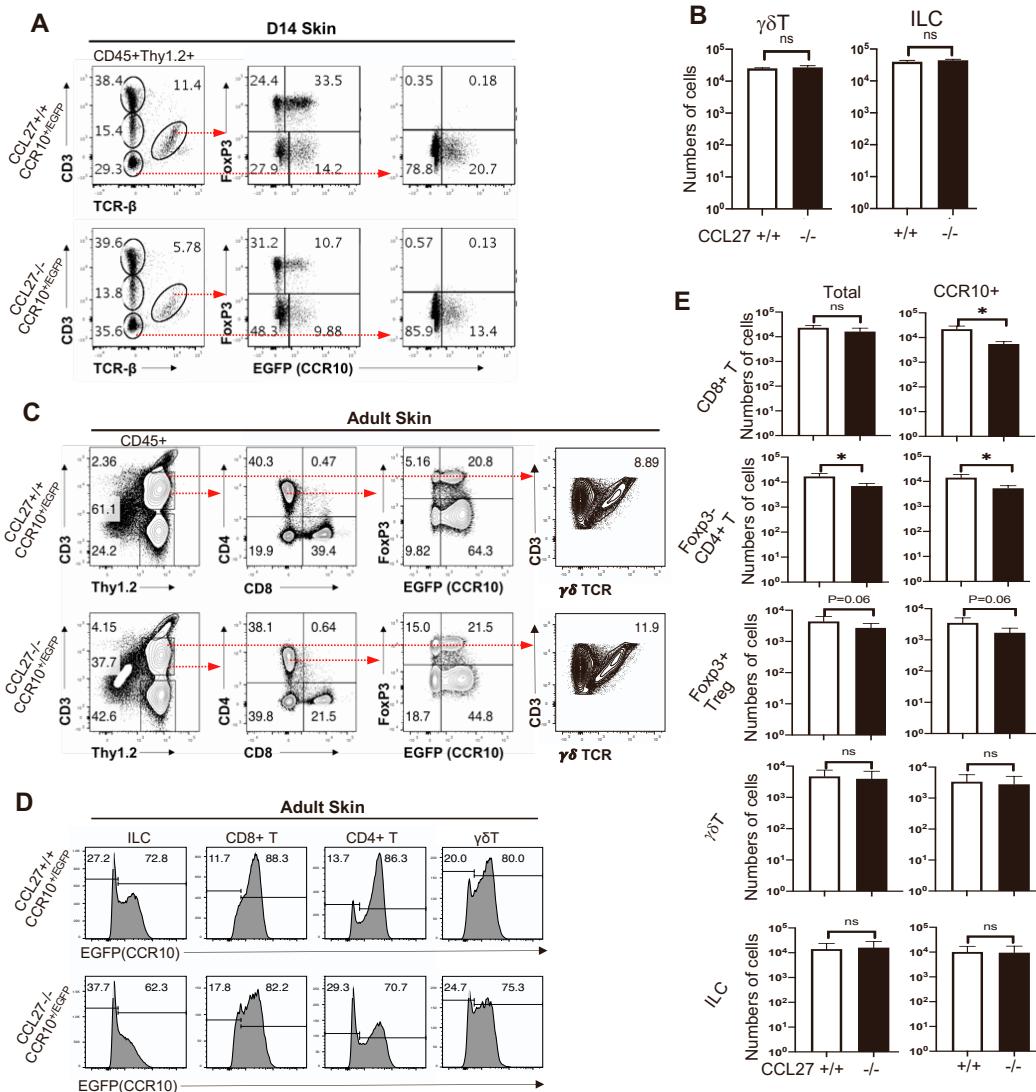

**Micha L. Davila, Ming Xu, Chengyu Huang, Erin R. Gaddes, Levi Winter, Margherita T. Cantorna, Yong Wang, and Na Xiong**

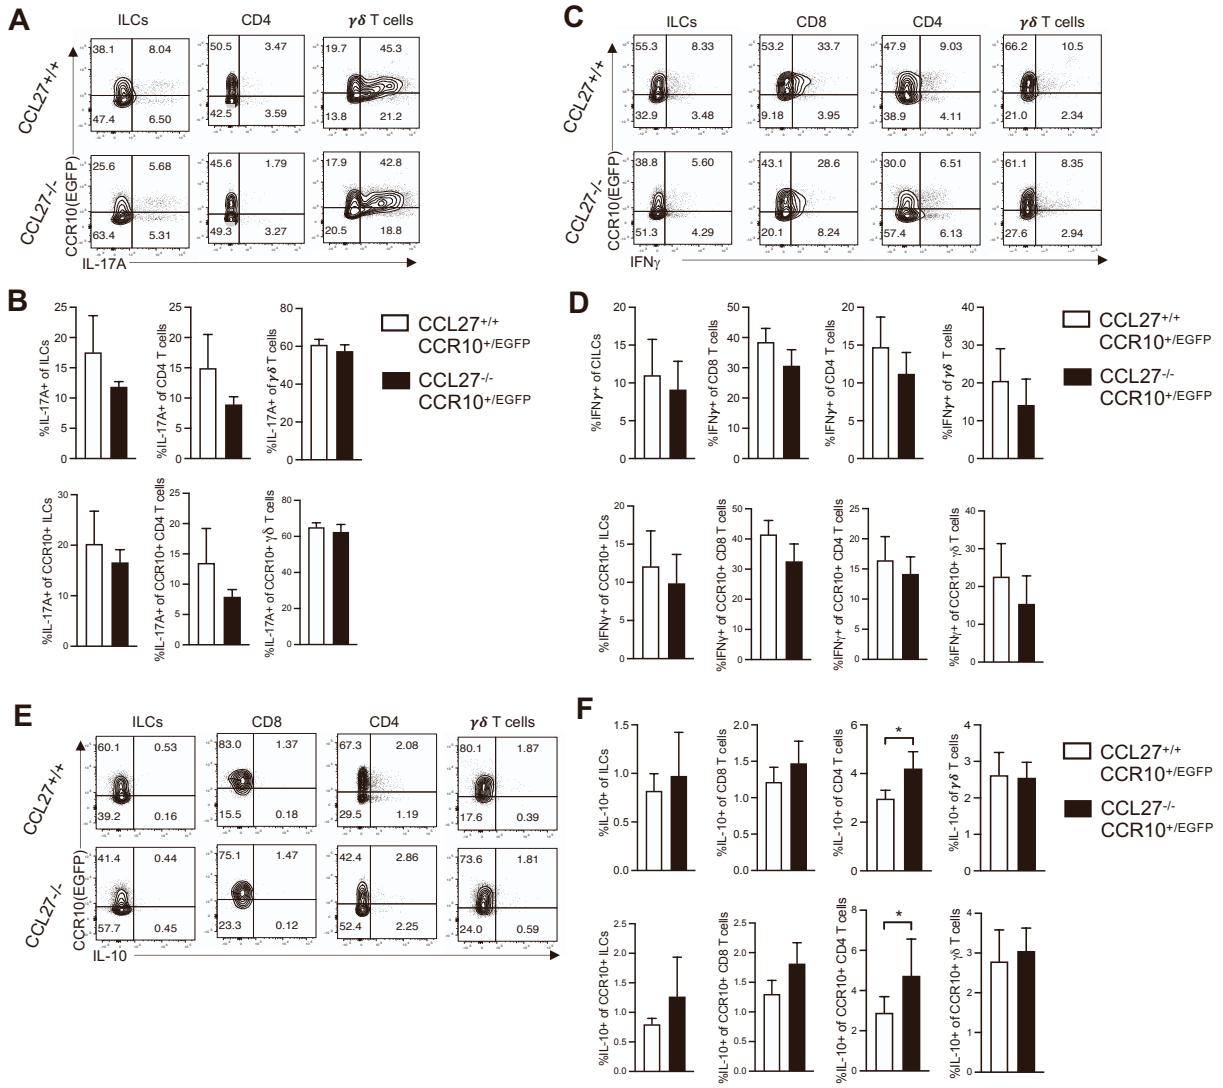

**Figure S1. Preferential localization of CCR10<sup>+</sup> lymphocytes near anagen phase hair follicles correlates with high CCL27 expression by follicular keratinocytes, related to Figure 1.** **A)** Representative immunofluorescent skin sections (14µm) stained with anti-CCL27 antibody. N=7 mice for D0, 1 week, and adult ages and 6 mice for 2 weeks. **B)** Fluorescent images (7µm) representative of skin at resting (telogen) and growing (anagen) phase of hair follicle cycling stained by *in-situ* hybridization with an antisense CCL27 RNA probe or a non-specific RNA probe. The control probe recognizes the DapB gene (accession # EF191515) of a soil bacterial strain *Bacillus subtilis* SMY. N=3 mice per HF cycle phase. Large red patches are non-specific signals of sebaceous glands that are found in both CCL27 and control probe-stained sections.

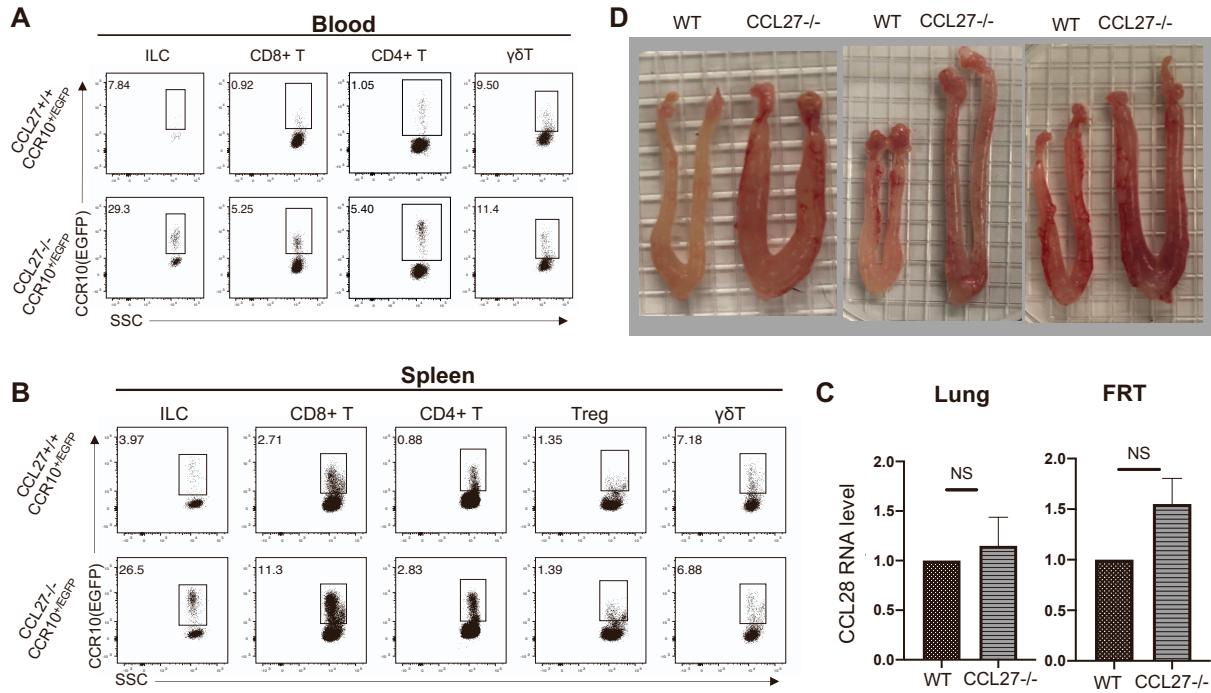

**Figure S2. CCL27a-knockout has little effect on the establishment of CCR10<sup>+</sup> lymphocytes in the skin, related to Figure 2.** **A)** Diagram of the CCL27a-targeting strategy in the CCL27a-knockout mouse line, modified from information obtained from the KOMP Repository ([https://www.mmrcc.org/catalog/sds.php?mmrcc\\_id=46967](https://www.mmrcc.org/catalog/sds.php?mmrcc_id=46967)). **B)** Genomic PCR genotyping CCL27a<sup>+/+</sup> (WT), heterozygous CCL27a<sup>+/-</sup> (Het), and homozygous CCL27a<sup>-/-</sup> knockout (KO) mice. Band sizes of CCL27a-WT and CCL27a-KO alleles are 435bp and 520bp respectively. **C)** Representative immunofluorescent skin sections (15µm) from CCL27a<sup>-/-</sup> and CCL27a<sup>+/+</sup> mice stained with anti-CCL27 antibody. **D)** Real-time RT-PCR analysis of total CCL27, CCL27a, and CCL27b/Gm13306 expression in the skin of CCL27a<sup>-/-</sup> and CCL27a<sup>+/+</sup> mice. Normalized to β-actin. N=6 mice for each genotype. The predicted coding sequences of CCL27b and Gm13306 are same.

**Figure S3. Dysregulated presence of CCR10<sup>+</sup> lymphocytes in the skin of total CCL27-knockout mice, related to Figure 4.** **A-B)** FC analysis (A) of skin lymphocytes ( $CD45^{+}Thy1.1^{+}$ ) for numbers of different T cell subsets and ILCs (B) in two week-old CCL27<sup>+/+</sup>CCR10<sup>+/-EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/-EGFP</sup> mice.  $\alpha\beta T$  cells are  $CD3^{int+}TCR\beta^{+}$ . Treg cells are  $CD3^{int+}TCR\beta^{+}FoxP3^{+}$ . ILCs are  $CD3^{-}TCR\beta^{-}$ .  $\gamma\delta T$  cells are  $CD3^{int+}TCR\beta^{-}$  (excluding the  $CD3^{high}$  dendritic epidermal  $\gamma\delta T$  cells). N=5 for CCL27<sup>+/+</sup> and 4 for CCL27<sup>-/-</sup> mice. **C)** FC analysis of skin  $CD45^{+}$  immune cells of adult CCL27<sup>+/+</sup>CCR10<sup>+/-EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/-EGFP</sup> mice for different subsets of T cells and ILCs. **D)** Histograms of CCR10(EGFP) expression in the gated populations of skin T cell subsets and ILCs of adult CCL27<sup>+/+</sup>CCR10<sup>+/-EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/-EGFP</sup> mice. CD8<sup>+</sup> and CD4<sup>+</sup> T cells are gated on CD8<sup>+</sup> and CD4<sup>+</sup>  $CD45^{+}Thy1.2^{+}CD3^{int+}$ . ILCs are  $CD45^{+}Thy1.2^{+}CD3^{-}$ .  $\gamma\delta T$  cells are  $CD45^{+}Thy1.2^{+}CD3^{int+}TCR\gamma\delta^{+}$  (excluding  $CD3^{high}$  dendritic epidermal  $\gamma\delta T$  cells). **E)** Numbers of of total and CCR10<sup>+</sup> CD8<sup>+</sup>, Foxp3<sup>-</sup>CD4<sup>+</sup>, Foxp3<sup>+</sup>Treg,  $\gamma\delta$  T cells and ILCs in adult CCL27<sup>+/+</sup>CCR10<sup>+/-EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/-EGFP</sup> mice. N=11 samples each for total CD8<sup>+</sup> T cells, 5 each for CCR10<sup>+</sup> CD8<sup>+</sup> T cells, 5 each for Foxp3<sup>-</sup>CD4<sup>+</sup> and Foxp3<sup>+</sup>Treg cells, and 4 each for  $\gamma\delta$  T cells and ILCs.

**Figure S4. Minor shifts in the cytokine production capacity of skin lymphocytes in CCL27<sup>-/-</sup> versus WT mice at steady state, related to Figure 4.** **A-B)** FC analysis (A) and graphed percentages (B) of IL-17A production of stimulated skin lymphocytes from adult CCL27<sup>+/+</sup>CCR10<sup>+/+EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/+EGFP</sup> mice. N=7 mice for each genotype. **C-D)** FC analysis (C) and graphed percentages (D) of IFN $\gamma$  production of stimulated skin lymphocytes from adult CCL27<sup>+/+</sup>CCR10<sup>+/+EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/+EGFP</sup> mice. N=6 mice each. **E-F)** FC analysis (E) and graphed percentages (F) of IL-10 production of stimulated skin lymphocytes from adult CCL27<sup>+/+</sup>CCR10<sup>+/+EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/+EGFP</sup> mice. T cell populations are gated on CD45<sup>+</sup>CD3<sup>int+</sup> CD8<sup>+</sup>, CD4<sup>+</sup> or  $\gamma\delta$  TCR<sup>+</sup>. ILCs are gated on CD45<sup>+</sup>Thy1.2<sup>+</sup>CD3<sup>-</sup>. N=5 mice for each genotype.

**Figure S5. Increased accumulation of CCR10<sup>+</sup> lymphocytes in the blood, spleens and lungs and female reproductive tracts of total CCL27-knockout mice, related to Figure 6.** A-B) FC analysis gating on populations of T cell subsets and ILCs for their CCR10(EGFP) expression in the spleen (A) and blood (B) of adult CCL27<sup>+/+</sup>CCR10<sup>+/+EGFP</sup> and CCL27<sup>-/-</sup>CCR10<sup>+/+EGFP</sup> mice. C) Real-time RT-PCR analysis of relative CCL28 expression in lungs and female reproductive tracts (FRT) of CCL27<sup>-/-</sup> mice in comparison to WT controls. Normalized to β-actin. N=4 each for lungs and 3 each for FRT. D) Images of uteri of three pairs of WT and CCL27<sup>-/-</sup> female littermate mice.
