**This PDF file includes:**

Figures S1 to S15

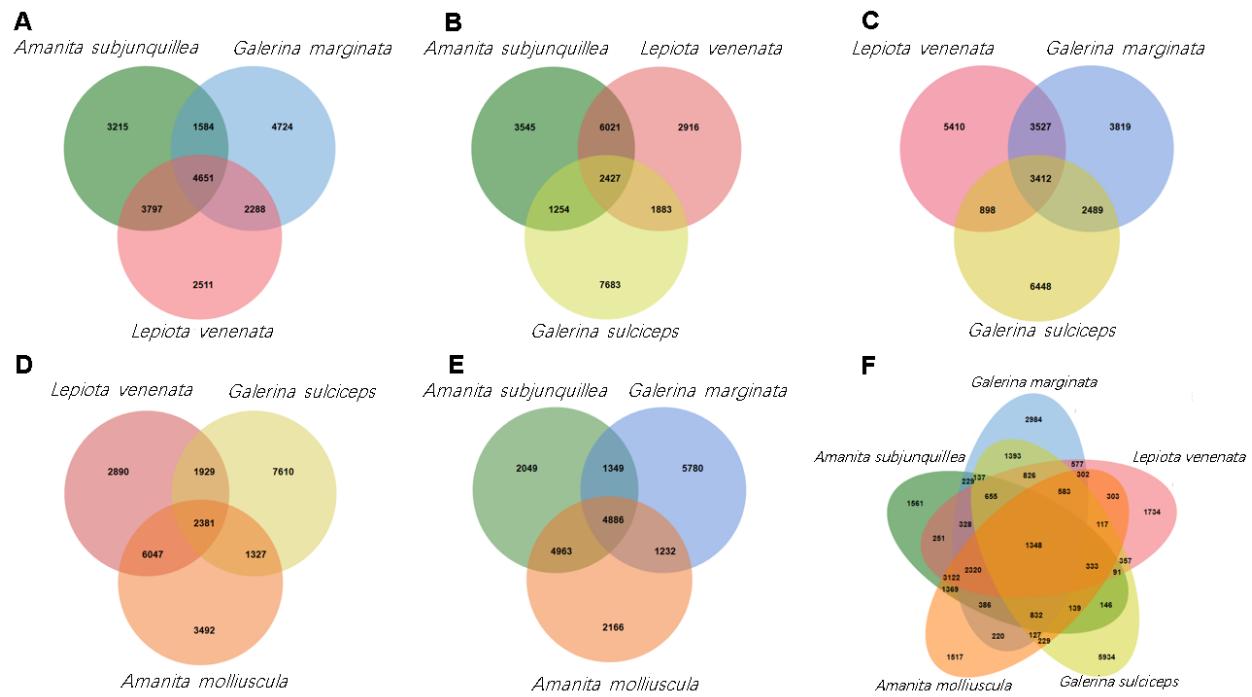

Tables S1 to S6

**Other supplementary materials for this manuscript include the following:**

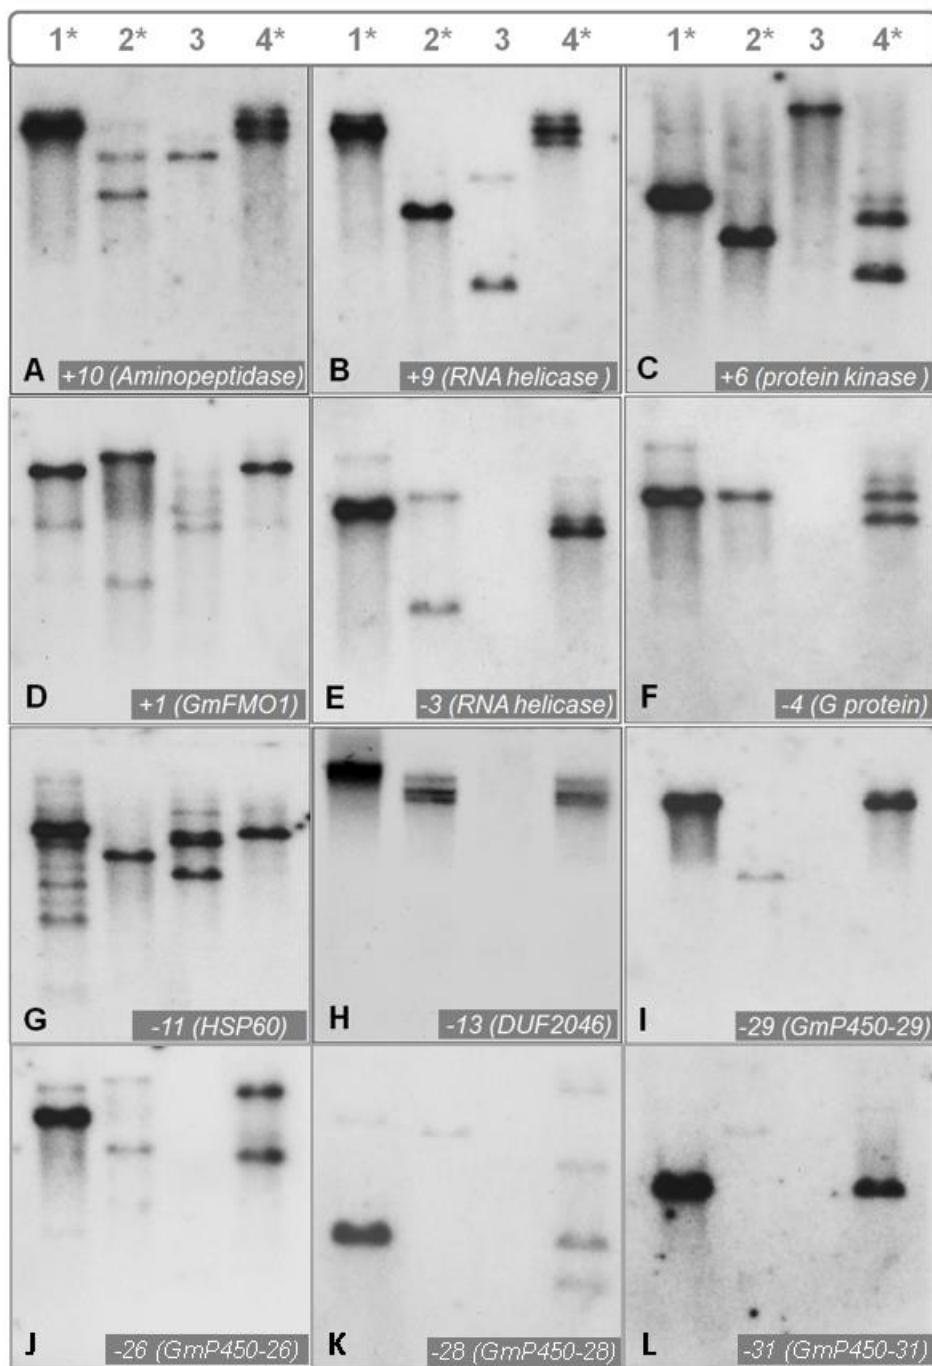

Datasets S1 to S3

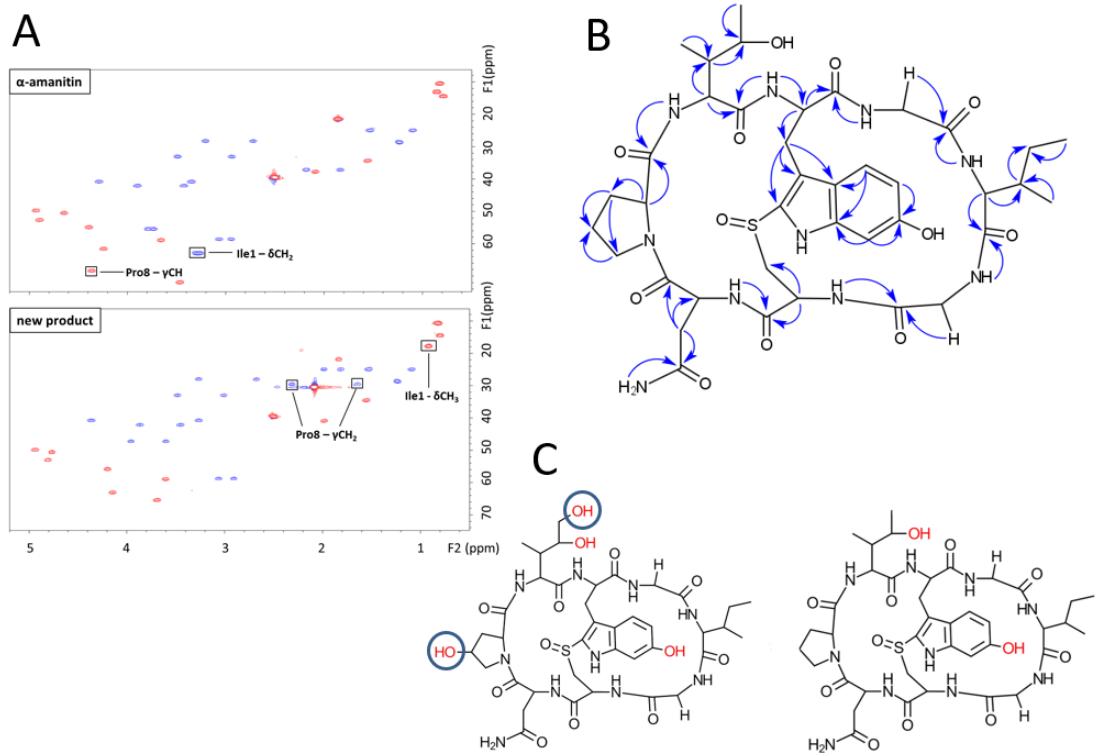

**Fig. S1.** Synteny analyses of the genomes of amanitin-producing agarics. Genome synteny within respective genus is indicated in the upper row, and the synteny between genera shown in the bottom row. Ribbons indicate genomic regions with significant synteny, and density of the ribbons represents syntenic levels. Statistics below each section are numbers of synteny block, anchor, block coverage of the species on the top, and block coverage of the species at the bottom.

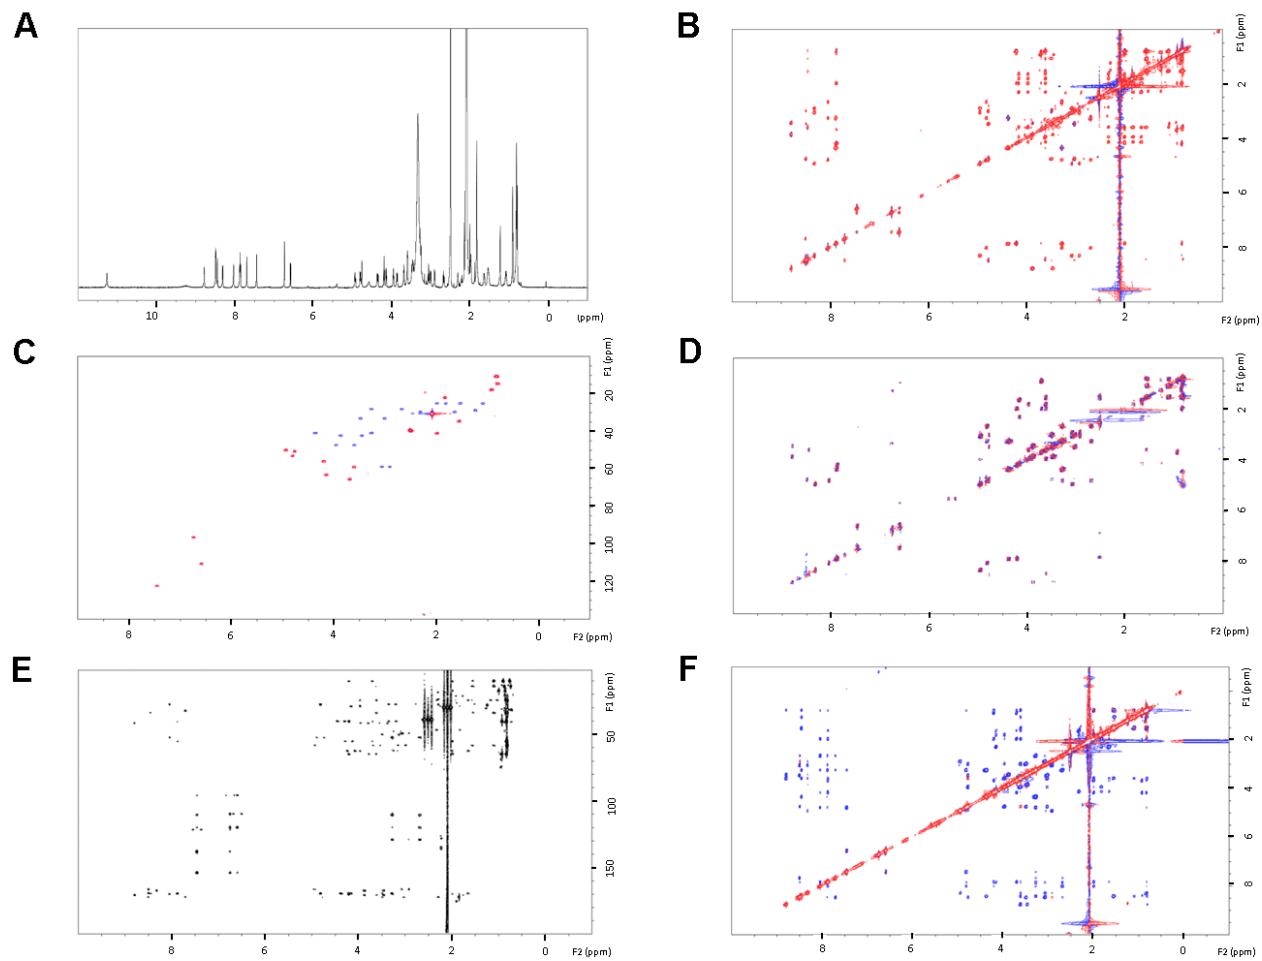

**Fig. S2.** Venn diagrams of predicted orthogroups in amanitin-producing *Amanita*, *Lepiota* and *Galerina* species. Species names are labeled above or beneath each circle.

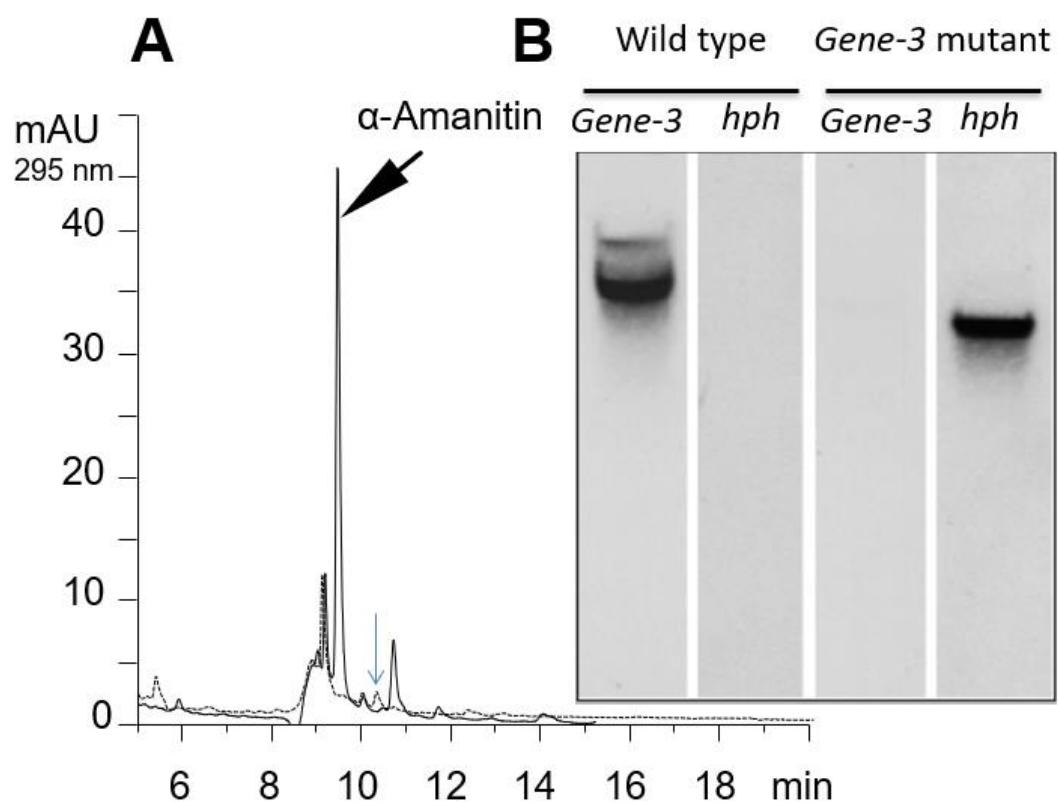

**Fig. S3.** DNA blotting of genes in the vicinity of *GmAMA1-1* in amanitin-producing and amanitin nonproducing *Galerina* species. Lanes 1, *G. marginata*; Lanes 2, *G. badipes*; Lanes 3, *G. hybrida*; Lanes 4, *G. venenata*. Asterisks indicate toxin-producing species. Gene number: position upstream (-) or downstream (+) of *GmAMA1-1*. Four CYP450 orthologs (I-L) are present in three amanitin-producing species and absent from the amanitin-nonproducing species.

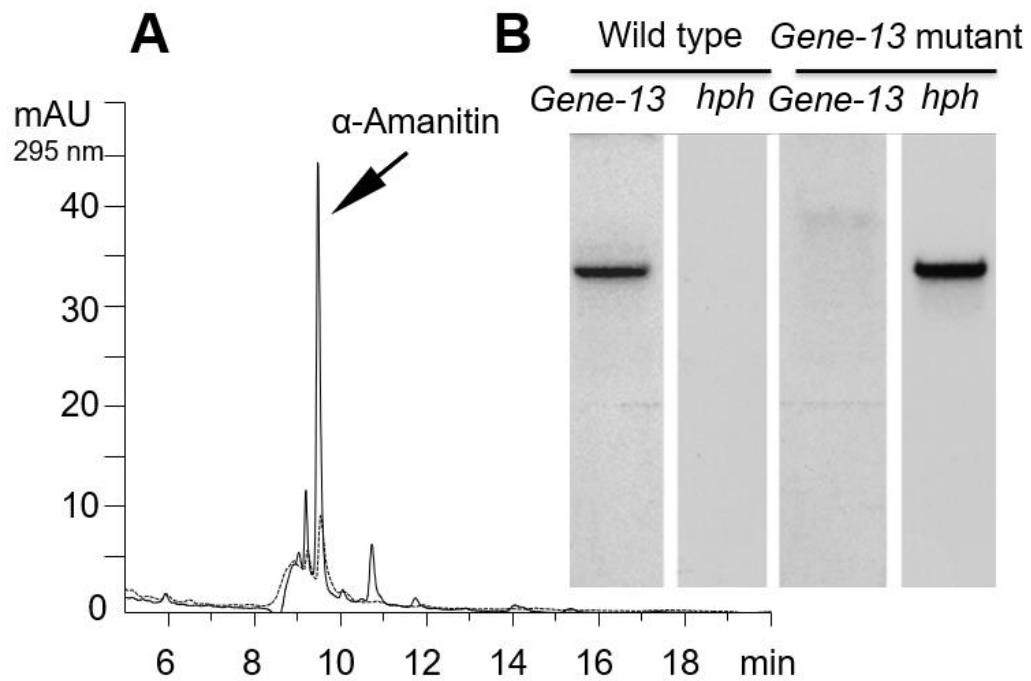

**Fig. S4.** Structure of θ-amanitin. (A)  $^1\text{H}$ - $^{13}\text{C}$  HSQC spectra of α-amanitin and θ-amanitin with major differences indicated. (B) Key HMBC correlations in θ-amanitin. (C) Structures of α-amanitin (left) and θ-amanitin (right): two blue circles indicate the missing hydroxyl groups in θ-amanitin.

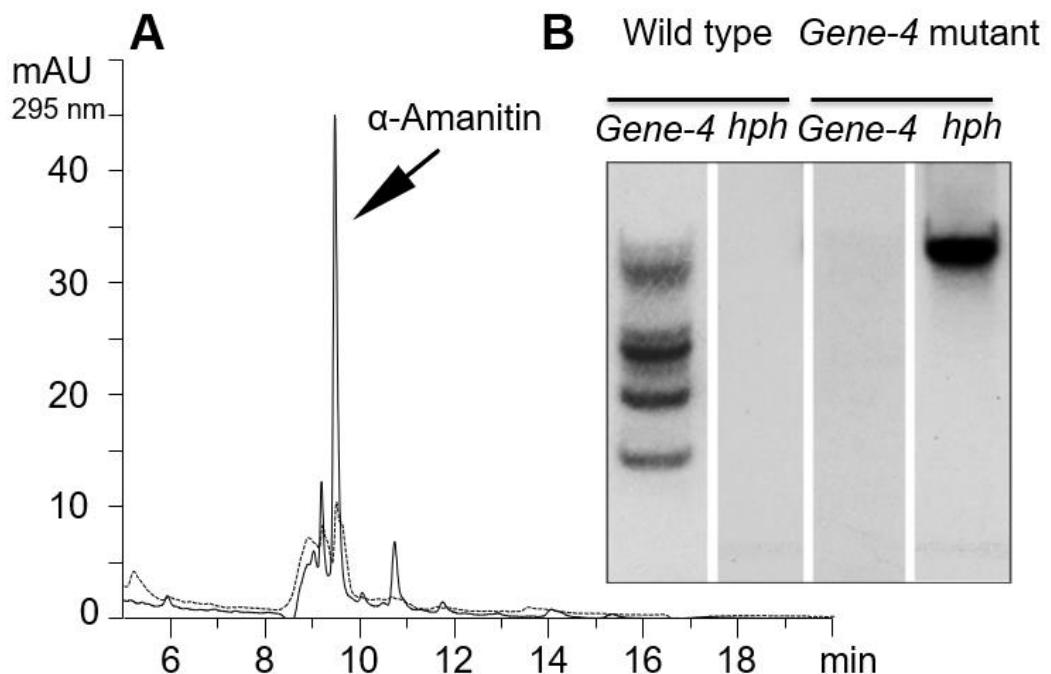

**Fig. S5.** 1D and 2D NMR analyses of θ-amanitin from *GmP450-29* mutant. (A) <sup>1</sup>H-NMR spectrum. (B) TOCSY spectrum. (C) <sup>1</sup>H-<sup>13</sup>C-HSQC spectrum, a section of this spectrum is shown in the main text as supplementary Fig. 5. (D) 2D DQF-COSY spectrum. (E) <sup>1</sup>H-<sup>13</sup>C-HMBC spectrum. (F) 2D ROSE spectrum.

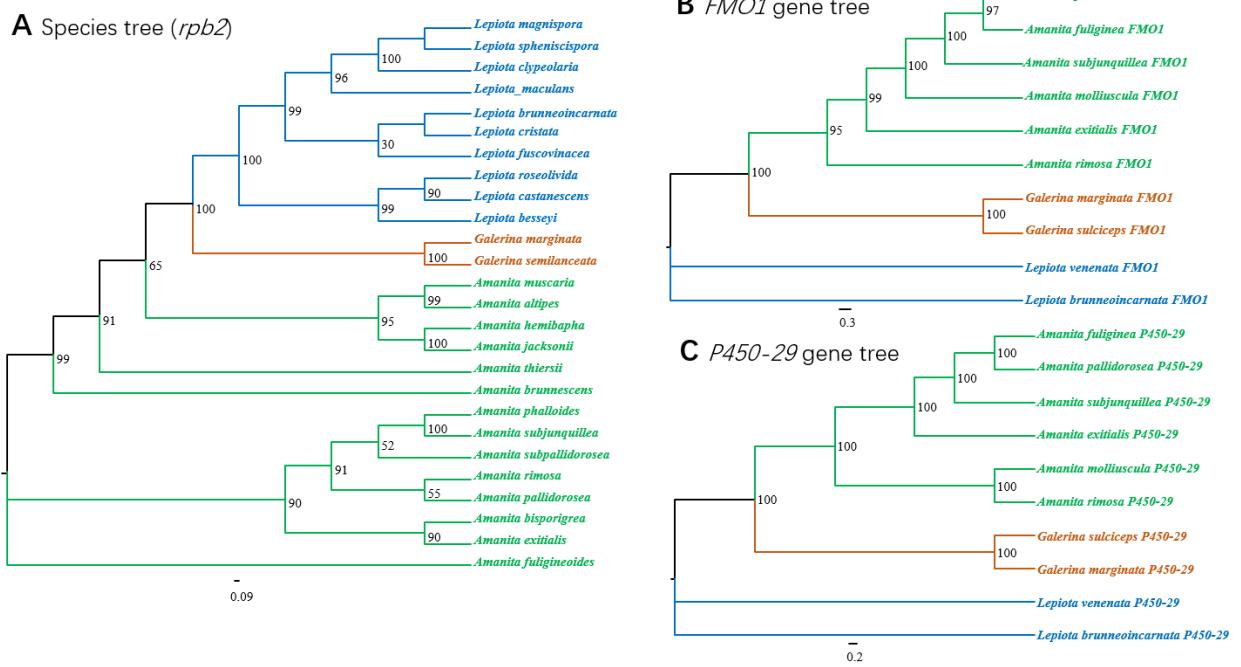

**Fig. S6.** Deletion of *Gene-3* in *Galerina marginata* results in loss of α-amanitin production and accumulation of a new product. (A) LC-MS analysis. Solid line, OD<sub>295</sub> for wild type; dashed line, OD<sub>295</sub> for *Gene-3* mutant. (B) DNA blot analysis for wild type and mutant; *hph* for hygromycin B marker.

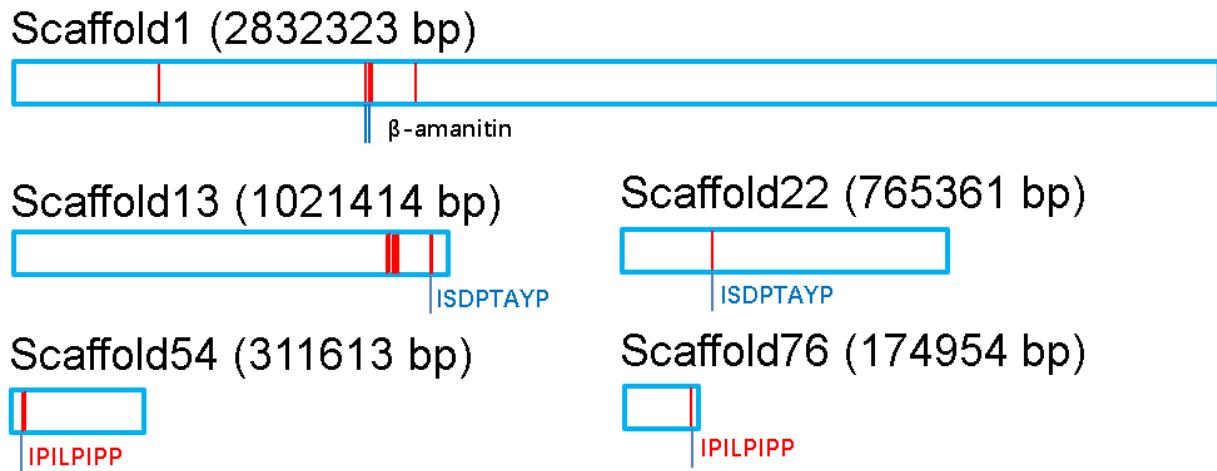

**Fig. S7.** Deletion of *Gene-13* in *Galerina marginata* results in drastic reduction of  $\alpha$ -amanitin. (A) LC-MS analysis. Solid line, OD<sub>295</sub> for wild type; dashed line, OD<sub>295</sub> for *Gene-13* mutant. (B) DNA blot analysis for wild type and mutant; *hph* for hygromycin B marker.

**Fig. S8.** Deletion of *Gene-4* in *Galerina marginata* results in drastic reduction of  $\alpha$ -amanitin. (A) LC-MS analysis. Solid line, OD<sub>295</sub> for wild type; dashed line, OD<sub>295</sub> for CYP450-29 mutant. (B) DNA blot analysis for wild type and mutant; *hph* for hygromycin B marker.

**Fig. S9.** Comparison of *FMO1* and *P450-29* with species tree (*rpb2*). *Amanita* was indicated in green, *Lepiota* in blue, and *Galerina* in brown (Maximum likelihood bootstraps over 50% are shown on the branches)

**Fig. S10.** Distribution of *MSDIN* genes present in two copies in the genome of *Amanita subjunquillea*. Blue lines under the scaffolds (blue boxes) represent the locations of the *MSDIN*s (red lines) in two copies. Amino acid sequences of the cyclic peptides were indicated on the right of the blue lines, with the same color for the same peptide. β-Amanitin-encoding *MSDIN* has two tightly-linked copies.

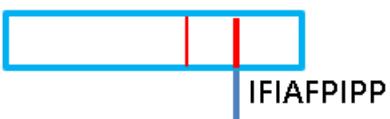

Contig 1 (1811650 bp)

Contig 8 (1101286 bp)

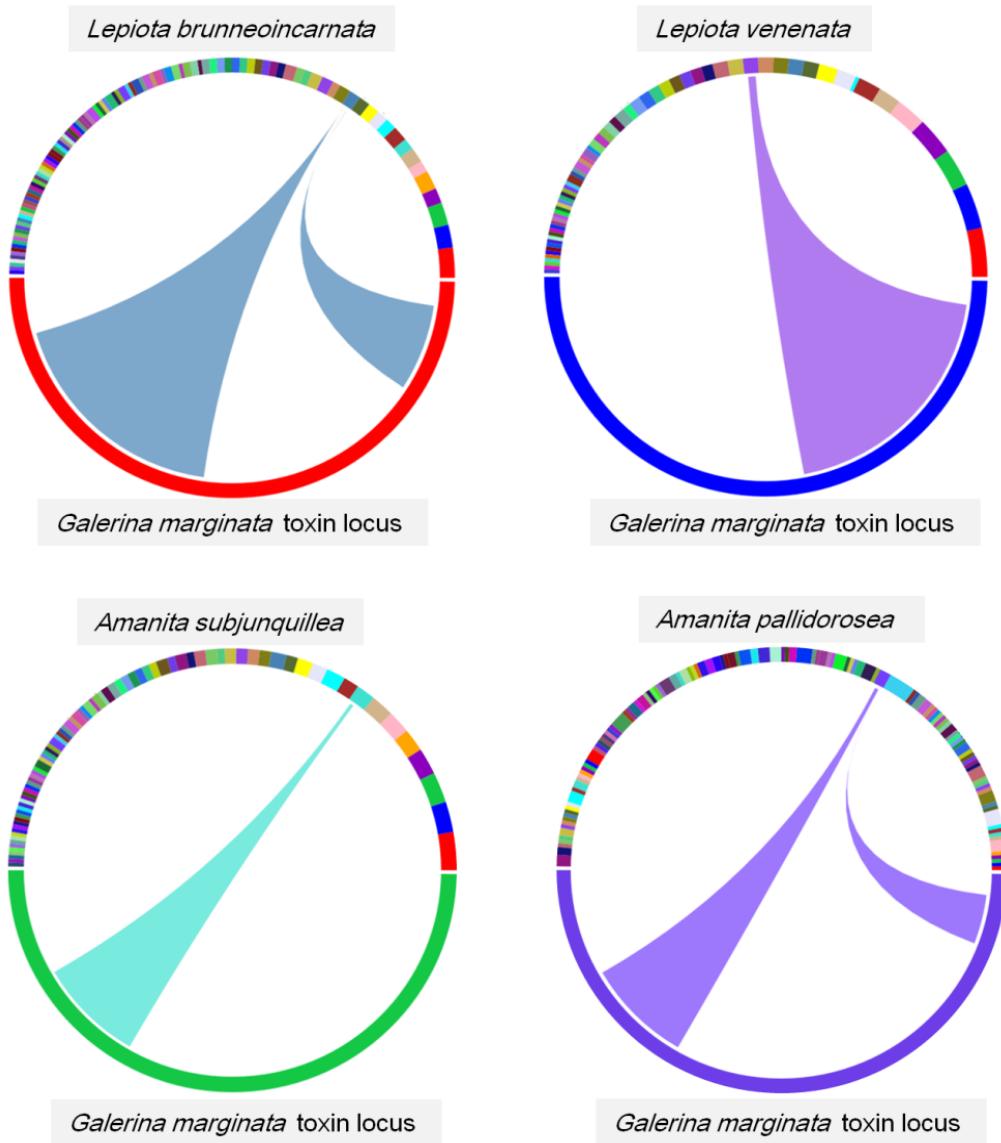

Contig 31 (543168 bp)

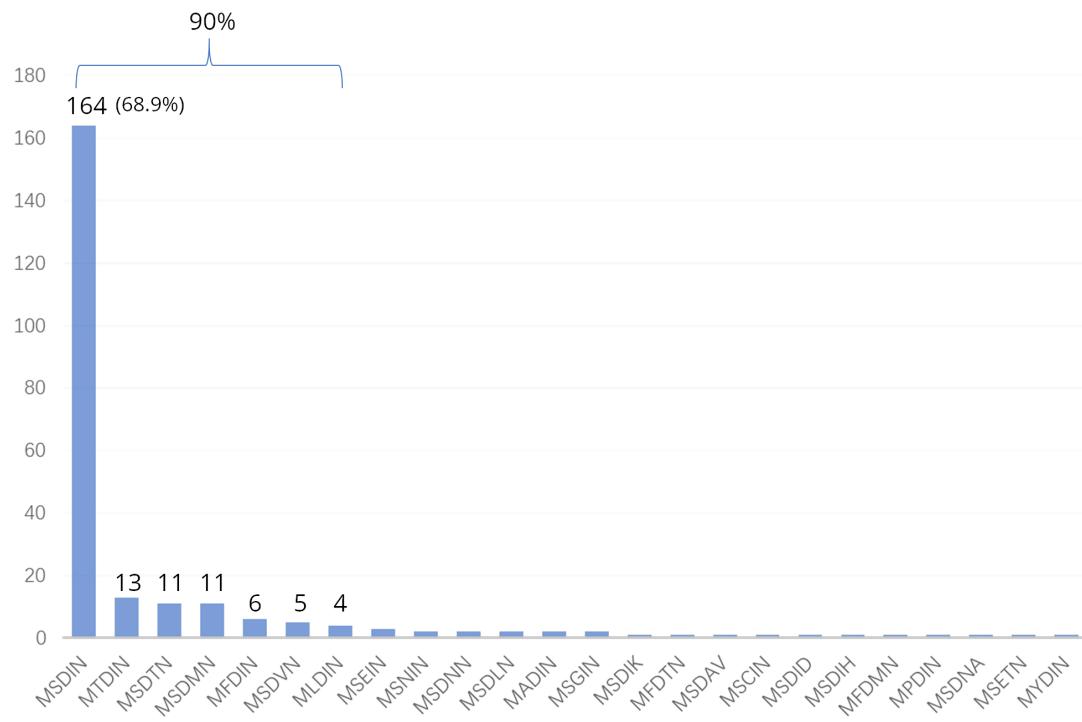

Contig 70 (170775 bp)

**Fig. S11.** The distribution of *MSDIN* genes present in two copies in the genome of *Amanita rimoso*. Blue lines under the contigs (blue boxes) represent the locations of the *MSDINs* (red lines) in two copies. Amino acid sequences of the cyclic peptides were indicated on the right of the blue lines. All denoted *MSDIN* genes in this figure have two tightly linked copies.

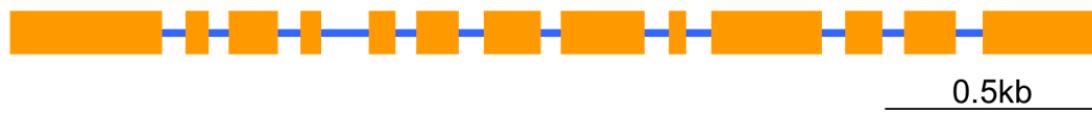

**Fig. S12.** Synteny analyses of the amanitin biosynthetic locus in *Galerina marginata* vs. those of *Amanita* and *Lepiota* species. The upper row shows two *Lepiota* loci vs the *Galerina* locus, while the bottom row represents two *Amanita* loci vs. the *Galerina* one. The *G. marginata* biosynthetic locus is placed as the lower half circles for all comparisons, and *Amanita* and *Lepiota* genomes as the upper half circles. Syntenic regions containing amanitin biosynthetic genes are connected by colored ribbons.

**Fig. S13.** N-terminals of *MSDIN* genes in 8 *Amanita* species. The species include *A. molliscula*, *A. exitialis*, *A. phalloides*, *A. subjunquillea*, *A. fuliginea*, *A. rimoso*, *A. pallidorosea*, and *A. bisporigera*

Gene structure of *AbP450-1* from *A. bisporigera*

Gene structure of *AbP450-2* from *A. bisporigera*

Gene structure of *AbP450-3* from *A. bisporigera*

>AbP450-1 deduced amino acid sequence
