Venn diagram (A) and tables of DEG in TE_part and ICMandTE according to maternal age (B, C and D)

Table B presents DEGs in ICMandTE, Table C presents DEGS in TE_part and Table D presents DEGS in common in both parts. Blue represents down regulated DEG (log₂FC<0) while red show up regulated DEG (log₂FC>0) in OM embryos compared to YM embryos. DEGs are in Entrez Gene ID or Ensembl Equine Gene ID (ENSECAG) when Entrez Gene ID was not available.

DEG: Differentially Expressed Genes (padj<0.05); log₂FC: Fold change in log₂; TE: Trophoblast; ICM: Inner Cell Mass; OM: group of embryos produced by Old Multiparous mares; YM: group of embryos produced by Young Multiparous mares

ICMandTE

Diagram of most perturbed GO and KEGG pathways (FDR < 0.05) in inner cell mass enriched part (ICMandTE) of equine D8 blastocysts according to maternal age

Pink pathways are the most enriched pathways in embryos from old multiparous mares and purple pathways are the most enriched pathways in embryos from young multiparous mares. Score represents False Discovery Rate using a Gene Set Enrichment Analysis.
