

SUPPLEMENTARY RESULTS

Comparison of Absolute Hemodynamic Parameters

Kruskal-Wallis group-level comparisons of absolute hemodynamic parameters in the common carotid artery (CCA) are summarized in Supplementary Table 1. There was significant overall difference in the absolute full width at half maximum (FWHM) ($p= 0.001$) among patient groups, while the remaining parameters showed no difference. Comparison of absolute hemodynamic parameters in the internal carotid artery (ICA) (Supplementary Table 2) showed no significant differences.

Pairwise comparisons of absolute FWHM, in the ICA and CCA, without with Holm correction for multiple comparisons are summarized in Supplementary Tables 3 and 4, respectively. Carotid web (CaW) and moderate atherosclerosis groups did not significantly differ in absolute FWHM in the CCA ($p=0.29$ uncorrected, $p=1$ corrected).

Supplementary Table 1 Comparison of Absolute CCA Parameters

Parameter*	Normal (n= 8) 2174.16	Mild Atherosclerosis (n= 7) 2400.79	Moderate Atherosclerosis (n= 6) 883.67	Severe Atherosclerosis (n=5) 1647.36	Carotid Web (n=15) 1718.00	<i>p</i> value**
