### eReferences

This supplementary material has been provided by the authors to give readers additional information about their work.

**eMethods.** Commission on Cancer Acknowledgment, Staging Strategy, NCDB Definition of Immunotherapy, Rationale Behind Selection of Study Periods, Missing Data Strategy, and Clinical Trial Variable

### **Commission on Cancer Acknowledgment**

The Commission on Cancer (CoC), the NCDB, and participating hospitals have not verified and are not responsible for the statistical validity of the data analysis or the conclusions derived by the authors.

### **Staging Strategy**

For all included cases of NSCLC and RCC, disease stage was recorded according to the *AJCC Staging Manual 7<sup>th</sup> Edition* prior to 2018, and according to the 8<sup>th</sup> Edition from 2018. For melanoma of the skin, the study spanned the 6<sup>th</sup> and 7<sup>th</sup> editions of the *AJCC Staging Manual*. The staging criteria for stage IV RCC remained unchanged across the included time frame. Changes of the staging criteria for stage IV NSCLC and melanoma across the editions did not affect the classification of stage IV in our study and therefore no corrective measures were employed.

### **NCDB Definition of Immunotherapy**

The NCDB datafield defines immunotherapy as any drug categorized as “Biologic therapy (Biologic response modifier, immunotherapy)” in the SEER\*Rx Interactive Antineoplastic Drugs Database.<sup>1,2</sup> Overall, >400 drugs are classified as immunotherapy, including a range of interleukins, interferons, antiangiogenic drugs, tumor vaccines, monoclonal antibodies, and checkpoint inhibitors. The database also lists drugs that are currently only available in clinical trials.

In 2013, six drugs were reclassified from chemotherapy to immunotherapy: alemtuzumab, bevacizumab, rituximab, trastuzumab, pertuzumab, and cetuximab.

### **Rationale Behind Selection of Study Periods**

The NCDB provides data as annual aggregates. The eras around FDA approval for the included cancers were determined relative to the following FDA approval dates:

- NSCLC - nivolumab for metastatic NSCLC (Mar 4, 2015 for *squamous* NSCLC<sup>3</sup> and Oct 9, 2015 for *non-squamous* NSCLC)<sup>4</sup> and pembrolizumab for metastatic NSCLC (Oct 2, 2015)<sup>5</sup>. Therefore, the “pre-approval era” was considered to be 2011 to 2014 and the “early post-approval era” was 2015 to 2017.
- RCC - nivolumab for metastatic RCC (Nov 23, 2015)<sup>9</sup>. Therefore, the “pre-approval era” was considered to be 2012 to 2015 and the “early post-approval era” was 2016 to 2018. Because the drug was approved at the end of 2015, the approval year was included in the pre-approval era.
- Melanoma - ipilimumab for metastatic melanoma (Mar 25, 2011)<sup>6</sup>. Therefore, the “pre-approval era” was considered to be 2007 to 2010 and the “early post-approval era” was 2011 to 2013. In 2014, pembrolizumab (Sep 4, 2014)<sup>7</sup> and nivolumab (Dec 22, 2014)<sup>8</sup> were FDA-approved for metastatic melanoma.

We limited the pre-FDA approval period in our study to the four years before the respective approval date for two reasons:

- 1) Clinical stage reporting only became mandatory in the NCDB in 2008,<sup>10</sup> which is why >50% of staging information was missing (for melanoma) in early diagnosis years from 2004-2008.
- 2) The phase III trials of the first approved checkpoint inhibitors for NSCLC (NCT01295827 KEYNOTE-001)<sup>11</sup> and RCC (NCT01668784 CheckMate 025)<sup>12</sup> started in 2011 and 2012 respectively.

The clinical trial that led to approval of ipilimumab for melanoma started in 2004 (NCT00094653)<sup>13</sup>. However, to keep time frames consistent, we limited the pre-approval era for melanoma to the four years prior to FDA-approval, analogous to NSCLC and RCC.

For checkpoint inhibitors approved within the first 6 months of a calendar year the approval year was included in the *post*-approval era and when the FDA approval was in the second half of the calendar year the approval year was included in the *pre*-approval era. The early post-FDA approval era was limited to the first three years following FDA-approval as these were available for all three cancers.

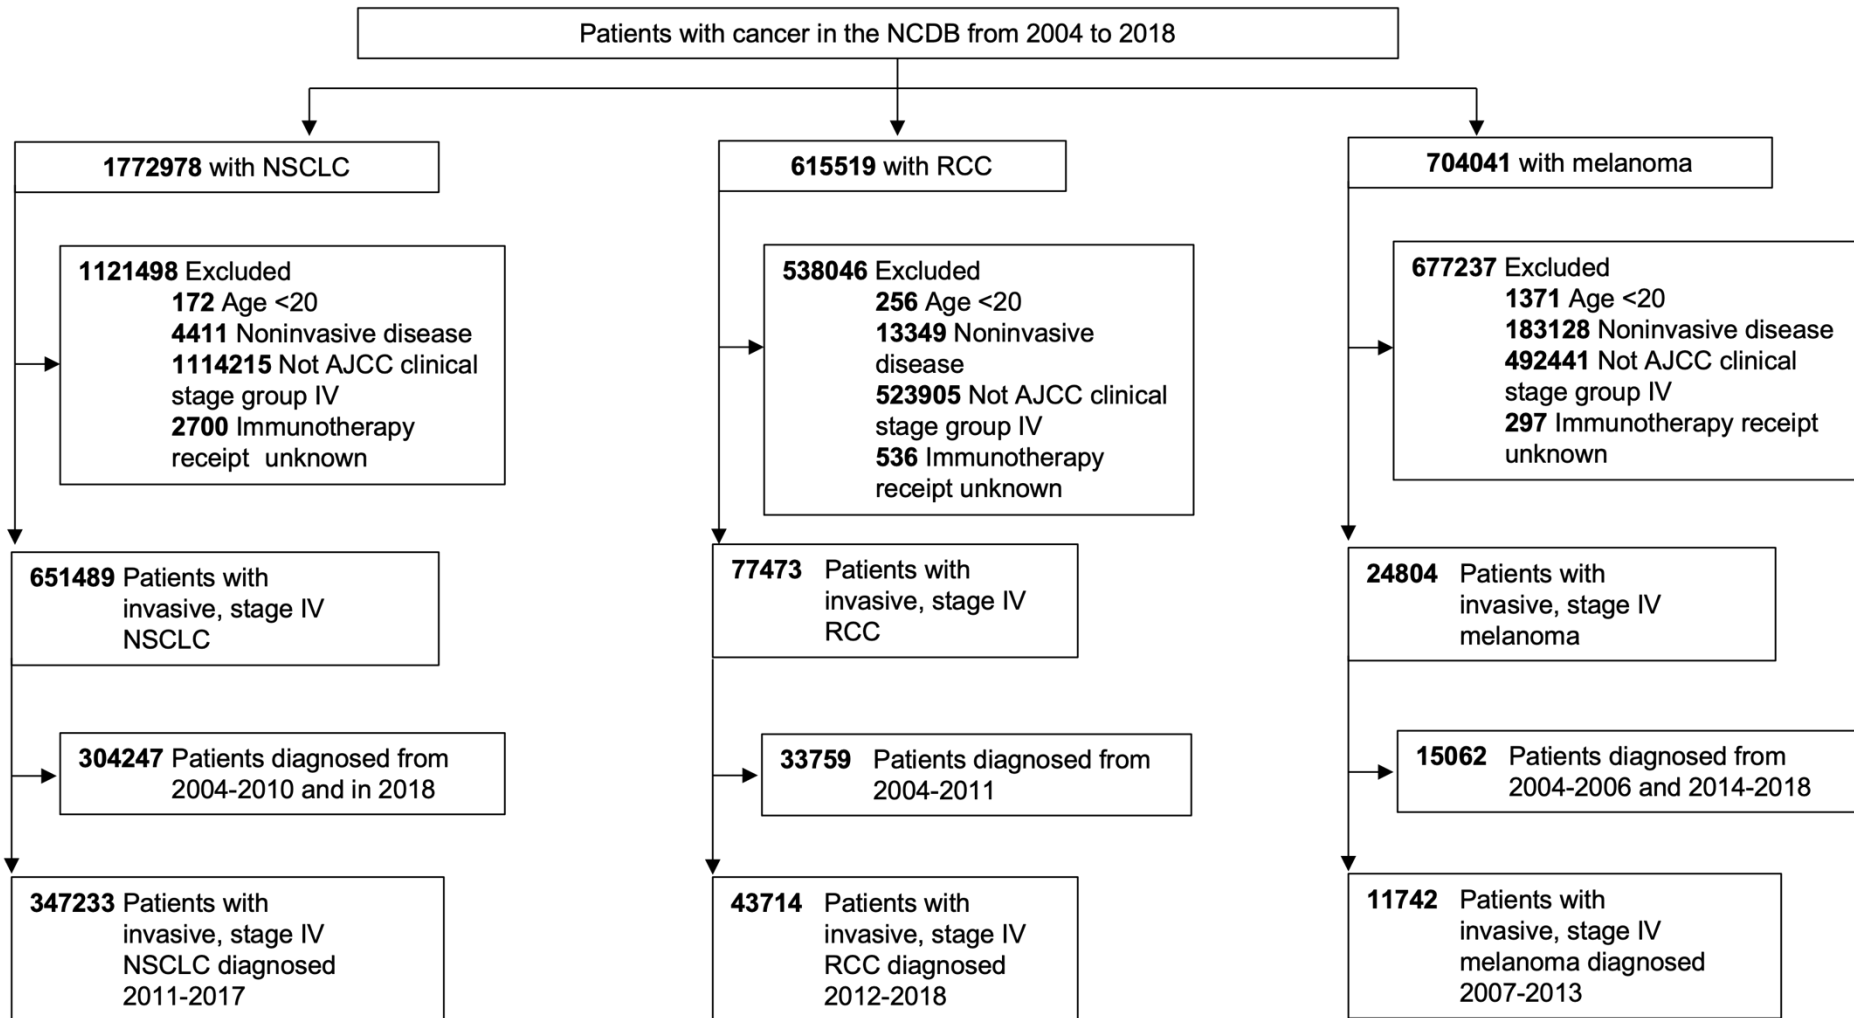

### **Missing Data Strategy**

Values were imputed for the following variables: race; ethnicity; insurance status; income; educational level; receipt of surgery, radiation, and chemotherapy; area of residence, and distance to treatment facility. In the NCDB, facility type and location are suppressed for all patients aged 39 years or younger to protect patient privacy. No patients aged 40 years or older had missing values for facility type and location. Therefore, facility type and location were not included as input variables in our multiple imputation model.

### **Clinical Trial Variable**

Due to likely underreporting in the NCDB, clinical trial participation could not be verified.
