Supplementary Figure 1. Percent with Self-Reported Symptoms at Pre-Infection, Infection, and Post-Infection Stages among Those Infected Non-Long-Haulers (n=234)

Notes

The pre-infection stage is 4 weeks before the COVID diagnosis or positive test.

The infection stage is the time of COVID diagnosis or positive test.

The post-infection stage is 12 weeks after the COVID diagnosis or positive test.

Symptoms were listed based on the proportion reported at the infection stage.

Wald (χ^2) tests were used to determine statistically significant differences in symptoms at the pre-infection stage and post-infection stage, and standard errors were clustered at the individual level.
