**Supplementary Fig. 1** Sequence alignment of PsbQ' and Psb27. PsbQ' sequences are colored in blue and Psb27 sequences are colored in green. The sequence alignment was performed in Clustal Omega (Sievers et al. 2011), and the Clustal Omega conservation identifiers are listed below each section, although they are mostly blank which means that most positions do not exhibit similarity. The corresponding sequence identity matrix is shown in **Supplementary Table 1**. *Synechocystis* 6803 is abbreviated *S. 6803*.

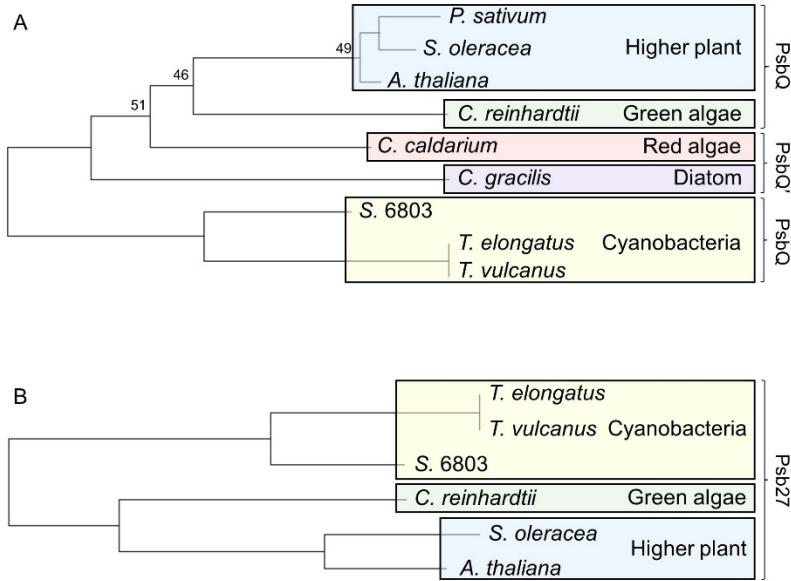

**Supplementary Fig. 2** Comparison of the CP43 luminal domain between apo-PSII, Psb27-PSII, and mature PSII. Only the core subunits D1, D2, CP47, and CP43 are shown. These are superimposed by the D1 and CP43 subunits only, and the CP43 subunits are colored according to the key. The apo-PSII structure corresponds to structure PDB 6WJ6, the Psb27-PSII structures correspond to PDB 7NHP for *T. elongatus* and PDB 7CZL for *T. vulcanus*, and the mature PSII structure corresponds to PDB 7D1T. *Synechocystis* 6803 is abbreviated *S. 6803*.

**Supplementary Fig. 4** Sequence alignment of PsbQ(') from different organisms. Residues with green font in the *Synechocystis* 6803 sequence exhibit sequence similarity  $\geq 50\%$  between sequences which also corresponds to the labeled residues in **Fig. 2**. For reference, residues within each of the four  $\alpha$ -helices in the four-helix bundle of the PsbQ subunits in the *Synechocystis* 6803 PSII structure (PDB 7N8O) and the *P. sativum* PSII structure (PDB 5XNL) are highlighted in yellow, cyan, green, and magenta for  $\alpha_1$ ,  $\alpha_2$ ,  $\alpha_3$ , and  $\alpha_4$ , respectively. Residues highlighted in red represent cleavage sites of signaling sequences identified by the SigP server (Almagro Armenteros et al. 2019). Residues not modeled in the corresponding molecular structures (or homology model) are highlighted in grey. The alignment was created using Clustal Omega (Sievers et al. 2011) and the sequence identifiers are shown below each section of the alignment. *Synechocystis* 6803 is abbreviated *S. 6803*. Note that a multiple sequence alignment was also performed without the signal sequences, but the outcome was similar.

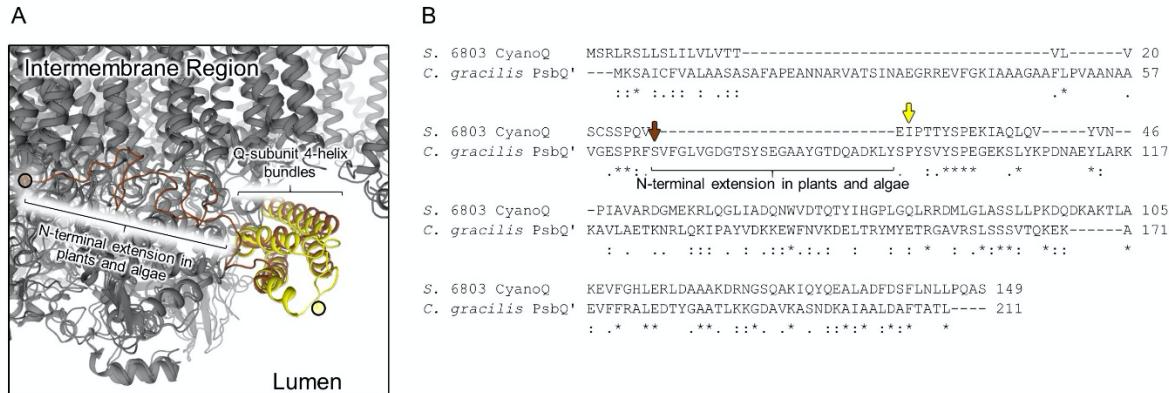

**Supplementary Fig. 5** Phylogenetic relationships of PsbQ' and Psb27. The evolutionary history for PsbQ' (A) and Psb27 (B) were inferred as described in **Methods** using MEGA7 (Kumar et al. 2016). The percentage of replicate trees in which the associated taxa are clustered together in the bootstrap test (100 replicates) are shown next to the branches except for those where that value is 100%. The tree with the highest log likelihood is shown (-3,533.66 and -1,715.90 for PsbQ' and Psb27, respectively). The Gamma distribution +G parameter was 2.2160 and 2.6728 for PsbQ' and Psb27, respectively. The trees are drawn to scale, with branch lengths measured in the number of substitutions per site. The analyses involved nine amino acid sequences for PsbQ' and six amino acid sequences for Psb27. There was a total of 272 positions in the final data set for PsbQ' and 182 positions in the final dataset for Psb27. *Synechocystis* 6803 is abbreviated *S.* 6803.

- Experimental structure
- Balanced
- Elec.-favored
- Hydro.-favored
- Vdw+Elec.

**Supplementary Fig. 6** Calculate PIPER binding energies for PsbQ('). Each panel shows an image of the docking simulation of PsbQ(') (colored) onto the PSII core (grey). The green ribbons correspond to the experimentally determined structures. The cyan, blue, magenta, and yellow ribbons correspond to the top model

for balanced, electrostatic-favored, hydrophobic-favored, and van der Waals + electrostatic forces (Kozakov et al. 2017). The table below each image shows whether the top model is consistent with the experimental model and the corresponding calculated PIPER binding energy for each coefficient set, with the lowest highlighted in light green. For *A. thaliana*, the docking simulation was performed with a homology model, and is therefore labeled with an “(h)”, and the “Consistent?” column refers to whether the PsbQ(’) orientation is consistent with the closely related PsbQ-containing PSII structures from *P. sativum* and *S. oleracea*. The energy reported in this table is PIPER energy calculated by ClusPro and do not correspond to valid binding free energy, but can be used for general comparison of favorable binding interactions in the docking algorithm (Kozakov et al. 2017). *Synechocystis* 6803 is abbreviated *S.* 6803.

**Supplementary Fig. 7** Example of PsbQ(') N-terminal extension in plants and algae compared to cyanobacteria. **A** The structures of PSII from *Synechocystis* 6803 (7N8O) and *C. gracilis* (PDB 6JLU) are shown superimposed and colored grey except for PsbQ(') subunit which are colored yellow for *S. 6803* and brown for *C. gracilis*. The closest modeled residue to the N-terminus is shown with a spot colored the same as its corresponding structure. **B** Sequence alignment of PsbQ(') from *Synechocystis* 6803 and *C. gracilis*. The closest modeled residue to the N-terminus is denoted with an arrow corresponding to the spots in panel A. *Synechocystis* 6803 is abbreviated S. 6803.

**Supplementary Fig. 8** Sequence alignment of Psb27 subunits. Residues with green font in the *T. elongatus* sequence exhibit sequence similarity  $\geq 50\%$  between sequences which also corresponds to the labeled residues in **Fig. 2**. For reference, residues within each of the four  $\alpha$ -helices in the four-helix bundle of Psb27 from the *T. elongatus* PSII structure (PDB 7NHP) and the *A. thaliana* Psb27 structure (PDB 5X56) are highlighted in yellow, cyan, green, and magenta for  $\alpha 1$ ,  $\alpha 2$ ,  $\alpha 3$ , and  $\alpha 4$ . Residues highlighted in red represent cleavage sites of signaling sequences identified by the SigP server (Almagro Armenteros et al. 2019). Residues highlighted in blue may be bacterial peptidase cleavage sites. Residues not modeled in the corresponding molecular structures (or homology model) are highlighted in grey. The alignment was created using Clustal Omega (Sievers et al. 2011) and the sequence identifiers are shown below each section of the alignment. *Synechocystis* 6803 is abbreviated S. 6803. Note that a multiple sequence alignment was also performed without the signal sequences, but the outcome was identical.

**Supplementary Fig. 9** Calculated PIPER binding energies for Psb27. Each panel shows an image of the docking simulation of Psb27 (colored) onto the PSII core (grey). The green ribbons correspond to the experimentally determined Psb27-PSII structure from *T. vulcanus* (PDB 7NHP). The cyan, blue, magenta, and yellow ribbons correspond to the top model for balanced, electrostatic-favored, hydrophobic-favored, and van der Waals + electrostatic forces (Kozakov et al. 2017). The table below each image shows whether the top model is consistent with the experimental model and the corresponding calculated PIPER binding energy for each coefficient set, with the lowest highlighted in light green. For *C. reinhardtii* and *S. oleracea*, the docking simulations were performed with homology models, and are therefore labeled with an "(h)". For all tables in this figure, the "Consistent?" column refers to whether the simulated Psb27 orientation is consistent with the experimental structures of PSII with Psb27 bound (Huang et al. 2021; Zabret et al. 2021). The energy reported in this table is PIPER energy calculated by ClusPro and do not correspond to valid binding free energy, but can be used for general comparison of favorable binding interactions in the docking algorithm (Kozakov et al. 2017). *Synechocystis* 6803 is abbreviated *S. 6803*.

**Supplementary Fig. 10** Lack of electrostatic potential corresponding to a  $\text{Cl}^-$  ion bound to Psb27 in the dimeric Psb27-PSII complex. The Psb27-PSII model (PDB 7CZL) in the corresponding map (EMD-30511) is shown at three contour levels. Even at very low contour, no electrostatic potential corresponding to the modeled  $\text{Cl}^-$  ion modeled with Psb27 is present, suggesting that it is incorrectly modeled.

## **Supplementary Tables**

**Supplementary Table 1** Sequence identity matrix of selected PsbQ(') and Psb27 sequences calculated using Clustal Omega (Sievers et al. 2011). Red font shows the calculated sequence identities from the alignment of Psb27 sequences compared to PsbQ(') sequences from different organisms. Black font shows the calculated sequence identities from the alignment of Psb27 sequences from different organisms (top left) or PsbQ(') sequences (bottom right). *Synechocystis* 6803 is abbreviated *S.* 6803.
