#### Supplemental Methods. Additional details regarding methods.

Original studies evaluating any guideline-recommended confirmatory test for PA were eligible if they included comparison to a reference standard. Studies that required multiple sequential tests to establish a diagnosis were not included if the performance of any single test could not be determined. Conference abstracts, reviews, editorials, and protocols were excluded. When the same group of patients was likely reported across several publications for the same test, only the most complete publication was included to avoid double counting.

For each study included, the number of true positive, false positive, false negative, and true negative cases were extracted (or manually calculated from available data). When the necessary data were not reported in the text or tables, they were derived from published figures using WebPlotDigitizer version 4.4 (Ankit Rohatgi, Pacifica, CA, USA). When multiple sensitivity and specificity pairs (at different thresholds) were reported for the same individuals in a single study, we only considered the threshold associated with the highest specificity (aligning with the primary purpose of the test to rule-in disease) or the one designated as "optimal" by the original investigators to avoid double counting. If variations of the same confirmatory test were performed multiple times in the same patients, the set most closely aligning to the testing protocol described by guidelines was used.<sup>1</sup>

Meta-analyses were conducted using hierarchical summary ROC (HSROC) models that included random-effects terms for variations in accuracy and thresholds between studies, and allowed for non-symmetrical ROC curves to be fitted.<sup>2</sup> The diagnostic accuracies of the different tests were compared between all studies (indirect comparisons) and, where possible, head-to-head from studies that evaluated more than one test against a common reference standard (direct comparisons).

We relied on visual inspection of the coupled forest plots and summary ROC plots to describe heterogeneity, rather than using the l<sup>2</sup> statistic, as the latter is univariate and does not account for threshold effects.<sup>3</sup> We explored for potential sources of heterogeneity using meta-regression, considering differences in methodological quality and clinical characteristics between studies, and incorporated these separately as covariates in the HSROC model.<sup>3</sup> The likelihood ratio (LR) test was used to compare models with and without the covariate terms to formally test for differences. To quantify differences, we calculated the relative diagnostic odds ratio (DOR), which is a summary measure of the relative accuracy between two tests, assuming the summary ROC curves were parallel.<sup>4</sup> We assessed for publication bias using Deeks' funnel plot, noting that the statistical test has low power to detect asymmetry when heterogeneity is large.<sup>3</sup>

Because summary statistics are only interpretable when studies share a similar threshold (but thresholds varied considerably in our current review), we estimated the sensitivities at discrete points on the summary ROC curve corresponding to the lower quartile, median, and upper quartile of the reported specificities to facilitate

comparisons.<sup>3</sup> We calculated the number of missed cases and over-diagnosed cases per 1000 patients and presented these in a "summary of findings" table with evidence profiles adapted from the Grading of Recommendations Assessment, Development and Evaluation (GRADE) framework.<sup>5,6</sup> Analyses were performed using SAS version 9.4 (SAS Institute Inc., Cary, NC, USA), Stata version 17.0 (StataCorp, College Station, TX, USA), and RevMan version 5.4.1 (The Cochrane Collaboration, Copenhagen).

## Table S1. Electronic search strategies.

A search strategy was developed with a health science librarian (DLL). Medical subject headings and author supplied keywords were combined using the Boolean operator "OR" and grouped into two themes: primary aldosteronism and confirmatory test. Both components were combined using the Boolean operator "AND." References of included articles were also searched to identify other relevant studies.

Table S2. Summary of data extraction she	et.
--	-----

Variable	Description
Citation	Citation.
Author	Last name of the first author.
Year	Year of publication. If the first author has published more than one article within the same year, enter the year using sequential letters (e.g., 2009a, 2009b, 2009c, etc.).
Country	Country in which the study was conducted. For multi-site trials, list all countries separated by a comma (e.g., USA, Canada, UK, and Australia). If this is not reported, use the country of origin of the first author.
Design	<ul> <li>Select from the following options:</li> <li>"Single-gate design" (single set of criteria for inclusion; entire study sample drawn from clinical population suspected to have primary aldosteronism [PA])</li> <li>"Two-gate design with healthy controls" (cases and controls are sampled from 2 distinct source populations; cases are known or highly likely to have PA, and controls are healthy participants)</li> <li>"Two-gate design with alternative diagnosis controls" (cases and controls are sampled from 2 distinct source populations; cases are known or highly likely to have PA, and controls are populations; cases are known or highly likely to have PA, and controls have a specific alternative condition similar to PA [e.g., essential hypertension])</li> <li>"Multi-gate design with healthy controls and alternative diagnosis controls" (cases and controls sampled from multiple populations; cases are known or highly likely to have PA, and compared with multiple controls, including healthy people and those with essential hypertension).</li> </ul>
Sampling	Select from the following options: <ul> <li>Consecutive patients</li> <li>Random sample</li> <li>Case-control (non-consecutive, non-random)</li> <li>Unclear</li> </ul>
Data collection	<ul> <li>Select from the following options:</li> <li>Prospective (e.g., consent was obtained prior to testing)</li> <li>Retrospective (e.g., chart review)</li> <li>Unclear</li> </ul>
N total	Total number of participants in all groups.
N disease	Total number of people with PA.
N unilateral	Total number of people with PA that were reported to have unilateral disease (either by presence of adrenal mass, lateralization, or surgery—as defined by study).
ТР	Number of true positive cases.
FP	Number of false positive cases.
FN	Number of false negative cases.
TN	Number of true negative cases.
Mean age	Mean age of all participants
Range age	If mean age not reported (or cannot be estimated), report age range when available.
Number male	Number of males of all participants.
Number hypokalemia	Number of participants with hypokalemia.
ARR threshold	Minimum ARR required for inclusion in study.
Confirmatory test	<ul> <li>Select from the following options:</li> <li>SIT = intravenous saline infusion test</li> <li>SLT = oral salt loading test</li> </ul>

	<ul> <li>EST - fludrogertigene augeregeigen test</li> </ul>
	FST = fludrocortisone suppression test
	CCT = captopril challenge test
	Note: there may be variations for a particular test (e.g., SIT may be
	performed recumbent or seated).
Confirmatory test protocol	Describe how confirmatory test was performed (including preparation,
Confirmatory to at	posture, time of day).
Confirmatory test interpretation	Describe how confirmatory test was interpreted.
Aldosterone units	Units for aldosterone (e.g., pmol/L)
Aldosterone assay	Type of laboratory assay for aldosterone
Renin units	Units for renin (e.g., mIU/L)
Renin assay	Type of laboratory assay for renin
Renin type	Plasma renin activity (PRA) vs. direct renin concentration (DRC)
Reference	Reference standard ("gold standard") used for disease verification:
	Clinical outcomes to targeted treatment
	Adrenal vein sampling (AVS)
	Histopathology
	Another confirmatory test: FST
	Another confirmatory test: SIT recumbent
	Another confirmatory test: SIT seated
	Another confirmatory test: SLT
	Another confirmatory test: CCT
	• Different reference used (e.g., patients who had a positive
	confirmatory test result received targeted treatment, but those with
	a negative confirmatory test result received another confirmatory
	test)
Reference details	Details of reference standard.
Verification	How many people received the reference test:
	Complete (everyone received the same reference test)
	<ul> <li>Partial (not everyone was subjected to the reference test)</li> </ul>
	Different reference tests     For partial varification, it contures the situation where a reference test is
	For partial verification, it captures the situation where a reference test is
	For partial verification, it captures the situation where a reference test is not applied to all (e.g., abnormal confirmatory testing gets additional work-
	For partial verification, it captures the situation where a reference test is not applied to all (e.g., abnormal confirmatory testing gets additional work- up or treatment and those with normal confirmatory test results get nothing

bias Patient selection	<ul> <li>For partial verification, it captures the situation where a reference test is not applied to all (e.g., abnormal confirmatory testing gets additional work-up or treatment and those with normal confirmatory test results get nothing at all).</li> <li>For different reference tests, it captures the situation where a different definition of PA is applied depending on the results of the confirmatory test (e.g., abnormal confirmatory testing gets AVS, but normal confirmatory results receives another confirmatory test).</li> <li>Risk of bias assessment for patient selection. <ul> <li>Low = "single-gate design," enrolling patients suspected (but not proven) to have PA.</li> <li>High = "two-gate design" or case-control studies at risk of spectrum bias (e.g., patients with florid disease were compared with those who were entirely normal).</li> <li>Unclear = not enough data to make judgment.</li> </ul> </li> <li>Concerns about applicability for patient selection. <ul> <li>Low = patients represent those that would likely receive a confirmatory test in clinical practice.</li> </ul> </li> </ul>

Index test risk of bias	Risk of bias assessment for index test.
Index lest fisk of blas	<ul> <li>Low = confirmatory test was interpreted without knowledge of reference standard and/or the interpretation threshold was prespecified.</li> <li>High = there was potential of subjective interpretation of the confirmatory test (e.g., some patients were already deemed to have diagnosis of PA, then threshold for positive/negative test was determined afterwards).</li> <li>Unclear = not enough data to make judgment.</li> </ul>
Index test applicability	Concerns about applicability of index test.
	<ul> <li>Low = confirmatory test similar to what is expected to be used in clinical practice (as per guidelines), or derived from objective standard.</li> <li>High = confirmatory test significantly different than what is done in clinical practice.</li> <li>Unclear = not enough data to make judgment.</li> </ul>
	Note, confirmatory tests are commonly conducted and interpreted as
	<ul> <li>follows, adapted from the Endocrine Society 2016 guidelines <sup>1</sup>:</li> <li>SLT: 3-7 d of salt loading (verified with urine sodium &gt;200 mmol/d). Urine aldosterone &gt;10-12 mcg/d (28-33 nmol/d) suggests PA.</li> </ul>
	<ul> <li>SIT: fast overnight, then give 2 L NS over 4 hours while recumbent. Plasma aldosterone &gt;280 pmol/L (10 ng/dL) suggests</li> </ul>
	<ul> <li>PA and &lt;140 pmol/L (5 ng/dL) is considered normal.</li> <li>FST: fludrocortisone 0.1 mg q6h (or 0.25 mg daily) for 4 days with NaCl supplementation. Plasma aldosterone ≥140-170 pmol/L (5-6 ng/dL) suggests PA.</li> <li>CCT: captopril 25-50 mg x1 after seated or standing for 1 hour.</li> </ul>
	Plasma aldosterone reduction by <30% and/or ≥240 pmol/L (8.7
Reference standard risk of	ng/dL) after 2 hours suggests PA. Risk of bias assessment for reference standard.
bias	<ul> <li>Low = classification of disease was most likely correct and interpreted independently of index test (e.g., clinical response to targeted treatment). It is reasonable to assume that any disagreements between the reference standard and index test is because of misclassification from the index test.</li> <li>High = significant potential of misclassification of disease and/or inconsistent reference standard (e.g., AVS lateralization may miss bilateral forms of PA; histopathology may miss cases that did not undergo surgery and bilateral forms of PA that underwent surgery; another confirmatory test may be subject to false positive/negative results).</li> <li>Unclear = not enough data to make judgment.</li> </ul>
Reference standard	Concerns about applicability of reference standard.
applicability	<ul> <li>Low = interpretation of the reference standard is similar to what is expected in clinical practice.</li> </ul>
	<ul> <li>High = interpretation of the reference standard is significantly different than usual clinical practice.</li> </ul>
Flow and timing risk of	Unclear = not enough data to make judgment. Risk of bias assessment for study flow and timing.
bias	<ul> <li>Low = adequate time was provided for verification of disease status (e.g., clinical outcome following treatment); all patients received the same reference standard; all patients were accounted for in the analysis.</li> </ul>

	<ul> <li>High = inadequate time was provided for verification of disease status; only some patients received a reference standard and/or inconsistent reference standards were used; some patients were unaccounted for in the analysis.</li> </ul>
	<ul> <li>Unclear = not enough data to make judgment.</li> </ul>

Streeten, 1982	USA	NR age, NR sex, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Unclear	22/162	SIT (recumbent): discontinuation of all antihypertensives × 3 days minimum; furosemide 40 mg IV × 1 dose, then supine × 1 h, then ambulation × 2 h, then saralasin, then 2 L of 0.9% NaCl IV beginning around 12:30 PM over 3.5 h; PAC >236 pmol/L after infusion for diagnosis of PA	Immuno- assay	aldosterone, and hypokalemia; normal control subjects had normal BP, electrolytes, and 24 h urinary tetrahydro- aldosterone Partial verification: only those with hypokalemia <3.5 mmol/L and (either PRA <1.7 ng/mL/h or PAC >236 pmol/L after saline infusion test) received follow- up verification with either (1) deoxycorticoster one acetate 10 mg IM q12h ×3 days with failure to suppress PAC <236 pmol/L, or (2) presence of adrenal tumor on CT for diagnosis of PA; EH criteria not diven	
Thibonnier, 1982 <sup>17</sup>	Unclear	43.9 y, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive patients	Prospective	18/93	CCT: discontinuation of all medications × 1 week; NaCl 6 g PO qd × 3-5 days, then captopril 1 mg/kg PO × 1 at 9 AM; PAC collected 3 h after captopril >676 pmol/L for diagnosis of PA	Immuno- assay	criteria not given Different standards used: PA based on hypokalemia, low PRA, high basal aldosterone +/- surgery; renovascular and renal hypertension based on history, pyelography, and renal arteriography; EH based on non-suppressed	Unclear if study was conducted in France or USA; 2×2 table was reconstructed from figure 3

									PRA with normal investigations for renal disease	
Bravo, 1983 <sup>18</sup>	USA	NR age, NR sex, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Retrospective	80/150	SIT (recumbent): discontinuation of all medications × 2 weeks; recumbent × 30-45 min, then 25 mL/kg (e.g., 1.5 L for 60 kg person) of 0.9% NaCl IV beginning at 10 AM over 4 h repeated over 3 days; 24 h urinary aldosterone on final day >14 mcg/d for diagnosis of PA	Immuno- assay	Unclear: verification standard for differentiating PA from primary hypertension not stated; diagnostic criteria not given	The investigators described this as a salt loading test, but the actual intervention involved IV saline infusion
Lyons, 1983 <sup>19</sup>	USA	43.5 y, 18 M, 12 hypokalemia, NR ARR	Multi-gate with healthy and alternative diagnosis controls	Case-control	Prospective	12/31	CCT: discontinuation of spironolactone × 3 weeks and all other medications × 2 weeks; captopril 25 mg PO × 1 at 8 AM while seated; PAC collected 2 h after captopril >15 ng/dL for diagnosis of PA	Immuno- assay	Partial verification: SIT (recumbent) as verification standard for PA vs. EH, but diagnostic cut- offs not stated; normal control subjects did not have any tests	
Holland, 1984	USA	47.2 y, NR sex, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Prospective	26/120	SIT (recumbent): discontinuation of antihypertensives × 3 weeks; ambulatory × 2 h then recumbent to receive 2 L of 0.9% NaCl IV over 4 h; PAC ≥10 ng/dL after infusion for diagnosis of PA	Immuno- assay	Partial verification: participants selectively received FST with high salt diet and fludrocortisone 0.5 mg PO bid × 3 d with normal response considered as PAC <6 ng/dL and/or 24 h urinary aldosterone <6 mcg/d and/or 24 h urinary tetrahydro-	2×2 table was reconstructed based on the assumption that those who did not receive FST did not have PA

Naomi, 1985 <sup>21</sup>	Japan	NR age, NR sex, NR hypokalemia, NR ARR	Multi-gate with healthy and alternative diagnosis controls	Case-control	Prospective	7/39	CCT: captopril 50 mg PO × 1 in AM; PAC collected 90 min after captopril >15 ng/dL for diagnosis of PA	Immuno- assay	aldosterone <32 mcg/d. However, verification with FST was only performed in 26 of the 120 participants; those with positive SIT results were all assumed to have PA; otherwise, it was assumed that anyone who had a negative SIT as well as those who did not get FST did not have PA Different standards used: PA based elevated aldosterone and low PRA after furosemide injection with AVS lateralization; renovascular hypertension based on arteriography; renal parenchymal disease based on biopsy; EH based on normal response to SLT (but criteria not given); normal control subjects had no hypertension	No cases of bilateral PA included; it was assumed that subjects were unique from those reported in Naomi 1987, but it was not possible to confirm, though the reference standards were different and the subtypes of hypertension were also different between studies
Muratani, 1986 22,23	Japan	41.4 y, NR sex, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Prospective	19/91	CCT: discontinuation of antihypertensives × 2 weeks; high- salt diet for 7-10 days, then	Immuno- assay	Complete verification: SLT as verification standard for PA vs. EH, but protocol and	_

							recumbent for captopril 25 mg PO × 1 at 10 AM; PAC collected 2 h after captopril ≥8.9 ng/dL for diagnosis of PA		diagnostic cut- offs not stated	
Wu, 1986 <sup>24</sup>	Taiwan	38.2 y, 19 M, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Unclear	13/34	CCT: discontinuation of all medications × 1 week; captopril 100 mg PO × 1 at 9 AM; PAC collected 2 h after captopril >6 ng/dL for diagnosis of PA	Immuno- assay	Different standards used: APA based on pathological examination; bilateral PA based on hypokalemia, low PRA, abnormal response to SIT (cut-off not stated), and abnormal CT of the adrenals; EH based on exclusion of secondary causes of hypertension, but process not stated	
Hamlet, 1987	Australia	NR age, NR sex, NR hypokalemia, NR ARR	Multi-gate with healthy and alternative diagnosis controls	Case-control	Retrospective	8/26	SIT (recumbent): continuation of usual antihypertensive drugs; recumbent × 30 min, then 1.5 L of 0.9% NaCl IV beginning at 9 AM over 2.5 h; PAC ≥9.0 ng/dL after infusion for diagnosis of PA	Immuno- assay	Different standards used: APA based on surgically-proven adenoma; diagnostic criteria not given for EH and normal subjects	
Naomi, 1987 <sup>26</sup>	Japan	45.8, 15 M, 12 hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Prospective	12/32	CCT: discontinuation of antihypertensives × 2 weeks; unrestricted salt diet for 1 week, then recumbent for captopril 50 mg PO × 1 at 9 AM; PAC	Immuno- assay	Different standards used: APA based on hypertension, hypokalemia, elevated PAC, suppressed PRA, AVS lateralization,	Protocol with normal salt diet was included because CCT was performed in all patients in this group; no

Hambling, 1992 <sup>27</sup>	UK	NR age, NR sex, NR	Two-gate design	Case-control	Prospective	10/22	CCT: discontinuation of	Immuno- assay	and surgical confirmation; diagnostic criteria not given for EH Different standards used:	cases of bilateral PA were included in the study; it was assumed that subjects were unique from those reported in Naomi 1985, but it was not possible to confirm, though the reference standards were different and the subtypes of hypertension were also different between studies
		hypokalemia, NR ARR	with alternative diagnosis controls				all medications × 3 weeks; unrestricted salt diet for 1 week, then recumbent for captopril 50 mg PO × 1 at 9 AM; PAC collected 2 h after captopril >444 pmol/L for diagnosis of PA		PA based on FST (i.e., fludrocortisone 0.5 mg PO daily with salt supplements) but diagnostic criteria for SLT not given; diagnostic criteria not given for secondary hyperaldosteroni sm and EH	
Iwaoka, 1993	Japan	47.1 y, 85 M, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Unclear	16/190	CCT: discontinuation of all medications $\times$ 2 weeks; unrestricted salt diet, then captopril 50 mg PO $\times$ 1 at 9:30 AM; interpretation based on PAC and	Immuno- assay	Different standards used: PA based on hypertension, hypokalemia, low PRA, and high PAC with confirmation by surgery; renovascular	2×2 table reconstructed using table 3; patients with pheochromo- cytoma and Cushing syndrome included as comparators

							PRA collected 90 min after captopril, and using a formula (Q) with final value >0 for diagnosis of PA, where: Q = $-6.06$ $\times$ (PRA) <sup>2</sup> $-6.99 \times$ (PAC) <sup>2</sup> $-7.11 \times$ (PRA) $\times$ (PAC) $-7.06 \times$ (PRA) + 39.89 $\times$ (PAC) $-39.82$		hypertension based on >75% stenosis of renal artery by angiography; diagnosis criteria for other forms of hypertension not stated	
Agharazii, 2001 <sup>29</sup>	Canada	52 y, NR sex, 49 hypokalemia, NR ARR	Single- gate	Consecutive patients	Prospective	44/49	CCT: discontinuation of spironolactone × 6 weeks, BB and clonidine × 1 week; use of alpha blockers and CCBs if needed; seated for captopril 25 mg PO × 1; PAC collected 2 h after captopril >240 pmol/L (8.65 ng/dL) for diagnosis of PA	Immuno- assay	Complete verification: SLT as verification standard for PA vs. EH; everyone received 3 days of high sodium diet (300 mmol/d) with 24 h urine to confirm high sodium excretion; it was implied that the criterion for PA was a PAC >240 pmol/L (8.65 ng/dL) following oral salt loading	All participants had hypokalemia (i.e., severe disease)
Castro, 2002 <sup>30</sup>	USA	52.1 y, 7 M, 6 hypokalemia, ARR less than 30 ng/dL per ng/mL/h	Single- gate	Unclear	Retrospective	6/7	CCT: discontinuation of spironolactone × 3 months, and all other potentially confounding medications (except clonidine) × 1 week; use of alpha blockers if needed; captopril 25 mg PO × 1; ARR collected 2 h after captopril ≥26 ng/dL per ng/mL/h or PAC >12 ng/dL for diagnosis of PA	Immuno- assay	Different standards used: PA based on abnormal SIT (cut-off not stated), abnormal cross- sectional imaging, and lateralization with AVS or NP59 +/- surgical response; SIT was performed in 6 out of 7 people	Inclusion into the study required a screening ARR <u>less</u> <u>than</u> 30 ng/dL per ng/mL/h (i.e., under the typical threshold for case detection) and all participants were male with overt or borderline hypokalemia

Rossi, 2002 <sup>31</sup>	Italy	49.6 y, 32 M, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Case-control	Unclear	22/75	CCT: discontinuation of aldosterone antagonists × 8 weeks, and all other antihypertensives × 4 weeks; use of alpha blockers if needed; seated for captopril 50 mg PO × 1 between 7:30- 10 AM; ARR collected 90 min after captopril >35 ng/dL per ng/mL/h for diagnosis of PA	Immuno- assay	Complete verification: SIT (recumbent) as verification standard for PA vs. EH; everyone received 2 L 0.9% NaCl over 4 h from 8 AM to 12 PM while recumbent on a different date than CCT; post- infusion PAC ≥7.5 ng/dL used as reference standard for PA	Classified as two-gate study because 75 patients were known beforehand to have PA vs. EH, and all these had CCT and follow-up SIT; there were also 1046 people screened with CCT, but only those with positive tests received SIT, and therefore a 2×2 table could not be reconstructed for the larger group
Juutilainen, 2005 <sup>32</sup>	Finland	53.5 y, 36 M, 63 hypokalemia, NR ARR	Single- gate	Unclear	Retrospective	38/77	FST: discontinuation of spironolactone and estrogen $\times$ 4 weeks, and diuretics, ACEI, ARB, and BB $\times$ 2 weeks; received high-salt diet (16 g/d) and fludrocortisone 0.5 mg PO daily $\times$ 3 days with potassium supplementation if needed during a 5- day hospitalization; 24 h urinary aldosterone following salt loading $\geq$ 36.6 nmol/d for diagnosis of PA	Immuno- assay	Complete verification: clinical diagnosis as verification standard for PA vs. EH; chart review was used to look at laboratory data (i.e., screening test and confirmatory test [posture test], but no cut-offs stated), imaging data, and response to targeted treatment (i.e., improvement in hypokalemia and reduction in BP, but exact criteria not given)	The investigators described this as a salt loading test, but the actual intervention involved fludro- cortisone administratio n with a mandatory hospitaliza- tion

Giachetti, 2006	Italy	NR age, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive	Retrospective	48/82	CCT: discontinuation of antihypertensives × 4 weeks; use of alpha blockers and CCBs if needed; supine × 2 h, then captopril 50 mg PO × 1, then seated × 2 h; ARR collected 2 h after captopril >30 ng/dL per ng/mL/h for diagnosis of PA	Immuno- assay	Different standards used: four possible ways to diagnose PA with 3 of the 4 requiring abnormal SIT and the fourth way requiring an adrenal mass: (1) baseline elevated aldosterone (plasma or urine) plus upright PRA ≤1.0 ng/mL/h plus abnormal SIT (i.e., PAC ≥10 ng/dL); (2) baseline elevated aldosterone (plasma or urine) plus normal upright PRA plus abnormal SIT (i.e., ≥10 ng/dL); (3) normal baseline aldosterone (plasma and urine) plus upright PRA ≤1.0 ng/mL/h plus abnormal SIT with plasma (i.e., ≥10 ng/dL); (4) baseline elevated aldosterone (plasma or urine) plus upright PRA ≤1.0 ng/mL/h plus adrenal mass, even if SIT normal As above	2×2 table reconstructed using estimates of sens. and spec. from digitized version of figure 3
	ιταιγ	sex, NR hypokalemia,	gate	Consecutive	Renospective	01/110	preparation as above; recumbent	assay		2×2 table reconstructed using back-

		NR ARR					$\times$ 2 h, then 2 L of			calculation
							0.9% NaCI IV beginning at 8 AM over 4 h; PAC ≥7.0 ng/dL after infusion for diagnosis of PA			from table 3
Mulatero, 2006	Italy, Chile	50.6 y, NR sex, NR hypokalemia, variable ARR cut-offs (i.e., >40 ng/dL per ng/mL/h with PAC >15 ng/dL, or ARR >25 to >35 ng/dL per ng/mL/h, or >32 pg/mL)	Single- gate	Consecutive	Prospective	67/98	SIT (posture not specified): discontinuation of spironolactone × 8 weeks, other diuretics × 6 weeks, and all other antihypertensives × 3 weeks; use of alpha blockers or CCBs if needed; 2 L of 0.9% NaCI IV over 4 h; PAC ≥5 ng/dL after infusion for diagnosis of PA	Immuno- assay	Complete verification: FST as verification standard for PA vs. EH; everyone received fludrocortisone 0.1 mg PO q6h × 4 days with sodium and potassium suppl.; 24 h urinary sodium ≥3 mmol/kg/d with 10 AM post- FST PAC >5 ng/dL used as reference standard for PA	Each center originally used different cut-offs for SIT, but this was standardized to >5 ng/dL for the final analysis; 2×2 table extracted from table 2, though there was a slight difference in the sensitivity compared to what was reported in the narrative text
Schirpenbach, 2006 <sup>35</sup>	Germany	39.5 y, 56 M, 11 hypokalemia, ARR >21 pg/mL per mIU/mL	Multi-gate with healthy and alternative diagnosis controls	Case-control	Prospective	25/101	SIT (recumbent): discontinuation of spironolactone × 6 weeks; recumbent for 2 L of 0.9% NaCl IV beginning between 8-9:30 AM over 4 h; PAC ≥8.65 ng/dL after infusion for diagnosis of PA	Immuno- assay	Different standards used: PA based on repeatedly elevated ARR (>21 pg/mL per mIU/L), elevated 24 urinary aldosterone (>15 mcg/d), and previous abnormal SIT (i.e., PAC >8 ng/dL after 4 h); EH based on normal ARR, normal potassium, and normal 24 h urinary aldosterone; normal control	Index test and reference standard both included SIT

Mulatero, 2007	Italy	NR age, NR sex, 2 hypokalemia, NR ARR	Single- gate	Unclear	Retrospective	6/11	CCT: discontinuation of diuretics × 6 weeks, spironolactone × 8 weeks, and all other antihypertensives × 3 weeks; use of alpha blockers and CCBs if needed; seated for captopril 50 mg PO × 1 between 8-10 AM; ARR collected 2 h after captopril >30 ng/dL per ng/mL/h or PAC ≥8.5 ng/dL for diagnosis of PA	Immuno- assay	subjects had no hypertension or kidney disease, and did not use contraceptives Complete verification: concordant FST and SIT as verification standard for PA vs. EH	Participants were drawn from the same population as those in Mulatero 2006, but evaluating a different index test
Rossi, 2007a	Italy	47 y, NR sex, NR hypokalemia, NR ARR	Two-gate design with alternative diagnosis controls	Consecutive	Prospective	46/243	CCT: discontinuation of mineralocorticoid receptor antagonists × 6 weeks and other antihypertensives × 2 weeks; use of doxazosin and CCBs if needed; seated for captopril 50 mg PO × 1; PAC collected 1 h after captopril >13.9 ng/dL for diagnosis of PA	Immuno- assay	Partial verification: clinical diagnosis as verification standard ("4 corners approach") for PA vs. EH; APA based on a combination of all the following: (1) positive screening test (i.e., ARR ≥40 ng/dL per ng/mL/h), or post-captopril ARR ≥30 ng/dL per ng/mL/h, or logistic discrimination function [a risk score that predicts probability of PA based on	Participants from the PAPY cohort <sup>39</sup> with main results for the CCT reported in 2007a article <sup>37</sup> ; 2×2 table reconstructed for APA (but not possible for all PA); although the investigators described enrollment as consecutive, patients with idiopathic hyper- aldosteronis m were excluded from the final analysis; this

									baseline PRA, post-captopril aldosterone, and baseline K <sup>+</sup> ] ≥0.50, plus (2) lateralization with AVS or NP59, plus (3) adenoma seen with cross- sectional imaging, surgery, or pathology, plus (4) cure of hypokalemia and improvement/ cure of hypokalemia and improvement/ cure of hypotalemia and improvement/ cure of hypertension after surgery; diagnostic criteria not explicitly given for EH, but likely based on failure to fulfill all 4 criteria for PA, as above—but unclear if all patients, even those who had negative confirmatory testing, received entire verification process, including treatment	was a two- gate study design because people who had high probability features of PA as well as 1-in-4 patients who did not have features of PA were tested; CCT was included both as the index test and part of the reference standard
Rossi, 2007b	Italy	47.2 y, NR sex, NR hypokalemia, ARR ≥40 ng/dL per ng/mL/h	Two-gate design with alternative diagnosis controls	Consecutive	Prospective	120/ 317	SIT (recumbent): discontinuation of mineralocorticoid receptor antagonists × 6 weeks and other antihypertensives × 2 weeks; use of doxazosin and CCBs if needed; recumbent for 2 L of 0.9% NaCl IV	Immuno- assay	Partial verification: clinical diagnosis as verification standard ("4 corners approach") for PA vs. EH; APA based on same criteria as Rossi 2007a study <sup>37</sup> , as above;	Participants from the PAPY cohort <sup>39</sup> with the most complete reporting of the SIT in the 2007b article

Wu, 2009 41	Taiwan	47.9, 69 M, NR hypokalemia,	Single- gate	Consecutive	Prospective	71/135	beginning between 8-9:30 AM over 4 h; PAC ≥6.8 ng/dL after infusion for diagnosis of PA	Immuno- assay	bilateral (idiopathic) PA based on biochemical evidence of PA but without lateralization; diagnostic criteria not explicitly given for EH, but likely based on failure to fulfill criteria for APA or bilateral PA—but unclear if all patients, even those who had negative confirmatory testing, received entire verification process, including treatment Complete verification: SIT	2×2 table reconstructed
		ARR >30 ng/dL per ng/mL/h					antihypertensives × 2 weeks; use of diltiazem and doxazosin if needed; high-salt diet (6 g/d) × 3 days then seated for captopril 50 mg PO × 1 at 9 AM; ARR collected 1 h after captopril >35 ng/dL per ng/mL/h plus PAC >10 ng/dL for diagnosis of PA		(recumbent) as verification standard for PA vs. EH; everyone received 2 L 0.9% NaCl over 4 h while recumbent on a different date than CCT; post- infusion PAC ≥10 ng/dL used as reference standard for PA; subtype of APA based on modified "4 corners approach" (i.e., ARR >30 ng/dL per ng/mL/h, lateralization on AVS or NP59,	using table 2; it was assumed that subjects were unique from those reported in Wu 2010 because the CCT protocol, laboratory assay, and interpretation criteria were different between studies

Wu, 2010 42	Taiwan	48.7, 54 M, NR hypokalemia, ARR >30 ng/dL per ng/mL/h	Single- gate	Consecutive	Prospective	51/114	CCT: discontinuation of antihypertensives × 3 weeks; use of diltiazem and doxazosin if needed; seated for captopril 50 mg PO × 1; ARR collected 1.5 h after captopril >35.5 pmol per ng for diagnosis of PA	Immuno- assay	adenoma on CT, and post-SIT PAC >10 ng/dL or pathology- proven APA with surgical cure of hypertension) Complete verification: clinical diagnosis as verification standard for PA vs. EH; PA based on a combination of (1) ARR >30 ng/dL per ng/mL/h (using PRA) and (2) abnormal SIT test (post- infusion PAC >10 ng/dL) or 24 h urinary aldosterone ≥12 mcg/d; diagnostic criteria not explicitly given for EH, but likely based on failure to fulfill criteria	It was assumed that subjects were unique from those reported in Wu 2009 because the CCT protocol, laboratory assay, and interpretation criteria were different between studies
Myśliwiec, 2012 <sup>43</sup>	Poland	53 y, 79 M, 4 hypokalemia, NR ARR	Single- gate	Consecutive	Retrospective	13/198	SIT (recumbent): discontinuation of diuretics and spironolactone × 4 weeks, and other antihypertensives × 2 weeks; recumbent for 2 L of 0.9% NaCl IV over 4 h; PAC >6.5 ng/dL after infusion for diagnosis of PA	Immuno- assay	for PA Partial verification with different standards used: investigations to look for secondary causes of hypertension were variably performed (e.g., tests for cortisol and catecholamine excess); PA based on treatment	Suspected error in the original report because sens. of 93% and spec. of 97% in narrative text do not match the data from table 1 (i.e., absence of false negatives); therefore, 2×2 table was reconstructed

									response in those with a positive confirmatory test, but, no verification in those with negative tests	using data from the abstract because these numbers were the most clearly reported
Willenberg, 2012 <sup>44</sup>	Germany	NR age, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive	Unclear	21/59	FST: BP controlled with nifedipine, nitroglycerin, or alpha blockers; timing of discontinuation of other antihypertensives not stated; received fludrocortisone 0.1 mg PO qid × 4 days; PAC at 10 AM on 5 <sup>th</sup> day >53.5 ng/L (5.35 ng/dL) for diagnosis of PA	Immuno- assay	Complete verification: APA based on hypertension, elevated ARR (value not stated), PAC >2.5 ng/dL after SIT or FST, AVS with lateralization index of >3:1, and CT evidence of ipsilateral adrenal nodule of >5 mm; other causes of hypertension investigated with Doppler ultrasound of renal arteries, plasma metanephrines, and tests of renal function; criteria not explicitly given for non-APA, but likely based on failure to fulfill criteria for APA	No cases of bilateral PA included; the FST was included both as the index test and part of the reference standard; 2×2 table was reconstructed using table 3
	Germany	NR age, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive	Unclear	53/130	SIT (recumbent): medication preparation as above; recumbent for 2 L of 0.9% NaCl IV beginning between 8-9:30 AM over 4 h; PAC ≥31.5 ng/L	Immuno- assay	As above	As above

	1						(2 15 mm/-11) -ft			1
							(3.15 ng/dL) after infusion for			
							diagnosis of PA			
Ceral, 2014 45	Czech Republic	49.0 y, 30 M, NR hypokalemia,	Single- gate	Consecutive	Prospective	33/49	SLT: high-salt diet (6 g/d) $\times$ 3 days with 24 h urinary	Immuno- assay	Complete verification: SIT (recumbent) as	
		NR ARR					Na <sup>+</sup> ≥200 mmol/d to verify salt intake; 24 h urinary aldosterone after salt loading ≥36		verification standard for PA vs. non-PA; PA based on post- infusion PAC	
						10/50	nmol/d for diagnosis of PA		>100 pmol/L	7. 007
Nakama, 2014	Japan	NR age, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive	Retrospective	42/58	CCT: discontinuation of antihypertensives × 2 weeks; use of alpha blockers and CCBs if needed; recumbent for captopril 50 mg PO × 1; ARR collected 60 min or 90 min after captopril ≥200 pg/mL per ng/mL/h (20 ng/dL per ng/mL/h) for diagnosis of PA	Immuno- assay	Partial verification: PA based on having at least two positive confirmatory tests (CCT, SIT, and furosemide upright test)— but not everyone received all three confirmatory tests	The CCT was included both as the index test and part of the reference standard; not everyone received all three confirmatory tests that were required for verification; not explained why some tests were given to some patients, but not othore
	Japan	NR age, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive	Retrospective	40/57	SIT (recumbent): discontinuation of antihypertensives × 2 weeks; use of alpha blockers and CCBs if needed; recumbent for 2 L of 0.9% NaCI IV over 4 h; PAC ≥6 ng/L after infusion for diagnosis of PA	Immuno- assay	As above	not others The SIT was included both as the index test and part of the reference standard; not everyone received all three confirmatory tests that were required for verification;

										not explained why some tests were given to some patients, but not others
Kuo, 2015 47	Taiwan	60.9 y, 29 M, NR hypokalemia, ARR >35 ng/dL per ng/mL/h	Single- gate	Consecutive	Retrospective	31/60	CCT: discontinuation of antihypertensives × 3 weeks and other interfering medications (e.g., glucocorticoids, sex hormones, licorice, non- steroidal anti- inflammatory drugs) × 6 weeks; seated for captopril 50 mg PO × 1 at 9 AM, then ambulation; ARR collected 1 h after captopril >35 ng/dL per ng/mL/h plus PAC >10 ng/dL for diagnosis of PA	Immuno- assay	Different standards used: only those with negative CCT were verified with independent reference standard; clinical diagnosis as verification standard (modified "4 corners approach") for PA vs. EH; APA based on a combination of all the following: (1) positive screening test (i.e., ARR ≥35 ng/dL per ng/mL/h) and post- confirmatory test PAC >10 ng/dL, plus (2) lateralization with AVS or NP59, plus (3) adenoma seen with cross- sectional imaging, plus (4) cure of hypokalemia and improvement/ cure of hypertension after surgery; diagnosis of bilateral (idiopathic) PA	CCT was included both as the index test and part of the reference standard; only those with negative CCT were verified with independent reference standard; it was presumed everyone with positive CCT had PA (i.e., not allowing for possibility of false positive)

									based on biochemical evidence of PA without lateralization; EH based on ARR <35 ng/dL per ng/mL/h and negative confirmatory test—patients with negative confirmatory testing did not receive remainder of verification process, including treatment	
Cornu, 2016 <sup>48</sup>	France	48 y, 125 M, NR hypokalemia, ARR >64 pmol/L per mIU/L on at least two occasions	Single- gate	Consecutive	Retrospective	102/ 199	SIT (recumbent): discontinuation of mineralocorticoid receptor antagonists and renin antagonists × 6 weeks, and other interfering drugs × 2 weeks; use of peripheral alpha blockers, central alpha agonists, and CCBs if needed; recumbent for 2 L of 0.9% NaCl IV starting at 8 AM over 4 h; PAC >277 pmol/L (10 ng/dL) after infusion for diagnosis of PA	Immuno- assay	Complete verification: AVS as verification standard; AVS interpretation criteria included selectivity index >2:1 to verify cannulation, plus aldosterone: cortisol ratio of dominant side to non-dominant side of >4:1 to define lateralization	Disease defined by presence of lateralization on AVS
Kim, 2016 <sup>49</sup>	South Korea	50.9 y, 27 M, 4 hypokalemia, ARR >20 ng/dL per ng/mL/h	Single- gate	Consecutive	Prospective	51/64	CCT: discontinuation of ACEI, ARB, and BB × 4 weeks; use of alpha blockers and CCBs if needed; seated for captopril 50 mg PO	Immuno- assay	Complete verification: SIT (recumbent) as verification standard for PA vs. non-PA; PA based on post- infusion PAC	Suspected error in the original report because sens. of 98.0% and spec. of 78.6% in

							× 1; PAC collected 60 min or 90 min after captopril ≥13 ng/dL for diagnosis of PA		≥10 ng/dL	narrative text and table 2 do not match the data when back- calculated; 2×2 table was reconstructed using data from table 2 with rounding
Li, 2016 <sup>50</sup>	China	43.3 y, 90 M, 55 hypokalemia, ARR >30 ng/dL per ng/mL/h with PAC >15 ng/dL	Multi-gate with healthy and alternative diagnosis controls	Case-control	Prospective	76/141	SIT (recumbent): discontinuation of diuretics × 4 weeks, and ACEI, ARB, and BB × 2 weeks; use of alpha blockers and CCBs if needed; recumbent for 2 L of 0.9% NaCI IV starting at 8 AM over 4 h; PAC >11.45 ng/dL after infusion for diagnosis of PA	Immuno- assay	Different standards used: PA based on a combination of (1) ARR ≥30 ng/dL per ng/mL/h plus aldosterone ≥15 ng/dL, (2) PAC after saline infusion of ≥10 ng/dL, and (3) adrenal nodularity or thickening on CT; subtype of APA based on lateralization on AVS and/or surgery with pathologically- proven adenoma; subtype of bilateral PA based on normokalemia and improved BP after treatment with a mineralocorti- coid receptor antagonist; EH based on exclusion of secondary hypertension (but details not provided);	SIT (recumbent) was included both as the index test and part of the reference standard to verify PA; the reference standard was not equally applied to those who did not have PA

	Croose	53.6 y, NR	Single	Consecutive	Prospective	45/148	FST:	Immuno	normal control subjects had no hypertension Different	It was
Tsiavos, 2016	Greece	sex, 19 hypokalemia, NR ARR	Single- gate	Consecutive	Prospective		discontinuation of all drugs affecting the renin- aldosterone axis $\times$ 3 weeks; use of CCBs if needed; received NaCl 4 g PO tid $\times$ 4 days, fludrocortisone 0.1 mg PO q6h $\times$ 4 days, and dexamethasone 2 mg $\times$ 1 at midnight on 4 <sup>th</sup> day; PAC between 8:30-9 AM on 5 <sup>th</sup> day $\geq$ 3.0-3.1 ng/dL for diagnosis of PA	Immuno- assay	standards used: PA based on either a positive FST or, in the case of a negative FST, a combination of uncontrolled BP on ≥2 drugs, spontaneous hypokalemia, kaliuresis, and normalization of BP with spironolactone or eplerenone; EH was based on absence of all the criteria required for PA	It was presumed everyone with positive FST had PA (i.e., not allowing for possibility of false positive); cut- off for FST not clear (i.e., PAC 3.1 ng/dL on p. 24; PAC 3 ng/dL on pp. 23 and 26)
Song, 2018 <sup>52</sup>	China	47.9 y, 117 M, 127 hypokalemia, ARR ≥3.7 ng/dL per mIU/L	Two-gate design with alternative diagnosis controls	Consecutive	Prospective	135/ 236	SIT (recumbent): discontinuation of diuretics × 4 weeks, and ACEI, ARB, and BB × 2 weeks; use of alpha blockers and CCBs if needed; recumbent for 2 L of 0.9% NaCI IV starting at 8 AM over 4 h; PAC >10 ng/dL after infusion for diagnosis of PA	Immuno- assay	Different standards used: PA based on either a positive FST (fludrocortisone 0.1 mg PO q6h × 4 days; 24 h urinary sodium ≥3 mmol/kg/d with 10 AM post- FST PAC ≥8 ng/dL for diagnosis of PA) or, in the case of a negative FST, the presence of lateralization on AVS leading to biochemical cure after adrenalectomy; EH was based on absence of all the criteria required for PA	Patient selection applicability considered to be at low risk, even though there was a two-gate design, because all participants were considered to be at risk for PA before screening

	China	47.9 y, 117 M, 127 hypokalemia, ARR ≥3.7 ng/dL per mIU/L	Two-gate design with alternative diagnosis controls	Consecutive	Prospective	135/ 236	CCT: discontinuation of diuretics × 4 weeks, and ACEI, ARB, and BB × 2 weeks; use of alpha blockers and CCBs if needed; seated for captopril 50 mg PO × 1 at 8- 9 AM; PAC collected 2 h after captopril ≥13 ng/dL for diagnosis of PA	Immuno- assay	As above	As above
Meng, 2018 <sup>53</sup>	China	47.0 y, 63 M, 86 hypokalemia, ARR >30 ng/dL per ng/mL/h	Single- gate	Consecutive	Prospective	115/ 164	CCT: discontinuation of spironolactone × 6 weeks, other diuretics × 4 weeks, and other confounding antihypertensives × 2 weeks; use of alpha blockers and CCBs if needed; exact protocol for CCT not given (no dose of drug, body posture, or timing); PAC after captopril >16.7 ng/dL for diagnosis of PA (timing of collection not stated)	Immuno- assay	Different standards used: PA based on "biochemical diagnosis" (criteria not stated) with screening ARR ≥30 ng/dL per ng/mL/h; APA subtype based on lateralization on AVS, CT/surgical evidence of adenoma, and normokalemia with improvement/ cure of hypertension after surgery; EH based on ARR below 30 ng/dL per ng/mL/h, normal Doppler US of renal arteries, normal catecholamines, normal UFC, and normal renal function	Details about CCT protocol not given; details about biochemical testing for verification standard not given (i.e., unclear if confirmatory test used for diagnosis beyond screening ARR)
	China	47.0 y, 63 M, 86 hypokalemia, ARR >30	Single- gate	Consecutive	Prospective	115/ 164	SIT (posture not specified): discontinuation of spironolactone × 6	Immuno- assay	As above	Details about SIT protocol not given; details about

		ng/dL per ng/mL/h					weeks, other diuretics × 4 weeks, and other confounding antihypertensives × 2 weeks; use of alpha blockers and CCBs if needed; exact protocol for SIT not given (no dose of drug, body posture, or timing); PAC after infusion >11.2 ng/dL for diagnosis of PA (timing of collection not stated)			biochemical testing for verification standard not given (i.e., unclear if confirmatory test used for diagnosis beyond screening ARR)
Stowasser, 2018 <sup>54,55</sup>	Australia	55.3 y, 62 M, NR hypokalemia, ARR >70 pmol/L per mIU/L when PAC measured by immunoassay or >55 pmol/L per mIU/L when PAC measured by HPLC-MS/MS	Single- gate	Consecutive	Prospective	77/108	SIT (seated): discontinuation of diuretics × 4 weeks, and ACEI, ARB, BB, and dihydropyridine CCB × 2 weeks; use of verapamil, hydralazine, prazosin, and moxonidine if needed; seated for 2 L of 0.9% NaCI IV over 4 h; PAC ≥162 pmol/L with DRC <8.4 mIU/L and plasma cortisol lower (compared to baseline) after infusion for diagnosis of PA	HPLC- MS/MS	Different standards used: PA based on either a positive FST (fludrocortisone 0.6 mg PO q6h × 4 days; 10 AM post-FST PAC ≥165 pmol/L when measured using radioimmunoass ay or ≥133 pmol/L when measured using HPLC-MS/MS after being upright for 2 hours plus DRC <8.4 mIU/L for diagnosis of PA) or, in the case of a negative FST (in 1 patient), the presence of lateralization on AVS; "non-PA" was based on absence of all the criteria required for PA	The study double counts some patients (i.e., 100 participants with some having two tests for a total of 108 tests; specifically, 8 people had confirmatory testing before adrenalectom y for PA, and then again after adrenalec- tomy to confirm cure); it was probable that the patients included in the Ahmed 2014 article <sup>55</sup> were also included here because of overlapping study period

		ARR >70 pmol/L per mIU/L when PAC measured by immunoassay or >55 pmol/L per mIU/L when PAC measured by HPLC-MS/MS					weeks, and ACEI, ARB, BB, and dihydropyridine CCB × 2 weeks; use of verapamil, hydralazine, prazosin, and moxonidine if needed; recumbent for 2 L of 0.9% NaCI IV over 4 h; PAC ≥106 pmol/L with DRC <8.4 mIU/L and plasma cortisol lower (compared to baseline) after infusion for diagnosis of PA			the pooled meta-analysis of SIT in the present study, only the seated SIT was included from Stowasser 2018 <sup>54</sup>
Velema, 2018	Nether- lands	NR age, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive	Retrospective	146/ 276	SIT (recumbent): discontinuation of medications interfering with renin and aldosterone axis × 4-6 weeks; semi- recumbent for 2 L of 0.9% NaCl IV starting at 8-9:30 AM over 4 h; PAC ≥280 pmol/L after infusion for diagnosis of PA	Immuno- assay	Partial verification: PA based on clinical assessment by experts (e.g., endocrinologists and vascular medicine specialist) who reviewed demographics and clinical data (e.g., results of SIT, potassium, BP, and age) with final decision reached by consensus; anyone with post-infusion PAC <140 pmol/L assumed to have no PA (i.e., not allowing for possibility of false negative), but all indeterminate or positive saline infusion tests	

									were manually reviewed with the possibility of reclassification based on above criteria	
Kidoguchi, 2019 <sup>58</sup>	Japan	50.3 y, 49 M, NR hypokalemia, ARR >200 pg/mL per ng/mL/h	Single- gate	Unclear	Unclear	71/71	CCT: discontinuation of antihypertensives × 6 weeks; use of alpha blockers and CCBs if needed; supine for captopril 50 mg PO × 1 at 8 AM; reduction of PAC collected 90 min after captopril less than 30% from baseline for diagnosis of PA	NR	Complete verification: PA based on positive result from at least one of two alternate confirmatory tests: (1) upright furosemide loading test (furosemide 40 mg IV × 1 with PRA <2.0 ng/mL/h after 2 h collected in seated position) or (2) SIT (2L 0.9% NaCI IV × 1 with PAC >60 pg/mL [166 pmol/L] after 4 h collected in recumbent position)	In this study, everyone had PA and nobody was disease-free; the third interpretation criterion for CCT (i.e., reduction in PAC by less than 30% after captopril) was chosen for data extraction because it aligned closest with the Endocrine Society guidelines <sup>1</sup>
Okamoto, 2018 <sup>59</sup>	Japan	56 y, 48 M, NR hypokalemia, ARR >20 ng/dL per ng/mL/h	Single- gate	Consecutive	Prospective	75/102	CCT: discontinuation of antihypertensives (timing not stated); use of alpha blockers and CCBs if needed; captopril 50 mg PO × 1; ARR collected 90 min after captopril ≥42.2 ng/dL per ng/mL/h for diagnosis of APA	NR	Different standards used: PA based on at least 1 positive confirmatory test where every participant received at least 2 of 3 tests: (1) SIT (PAC >6 ng/dL), (2) CCT (ARR >20 ng/dL per ng/mL/h), and (3) upright furosemide loading test [PRA <2.0 ng/mL/h])	CCT was included both as the index test and part of the reference standard; in this study, there was a comparison of APA vs. non-APA (a group that included people with EH) and therefore it was not considered to be a pure

										subtyping study; 2×2 table reconstructed based on reported sens. and spec., but the final numbers do not perfectly match because it is possible that not everybody received the CCT in the actual study (but details not provided)
	Japan	56 y, 48 M, NR hypokalemia, ARR >20 ng/dL per ng/mL/h	Single- gate	Consecutive	Prospective	75/102	SIT (posture not specified): discontinuation of antihypertensives (timing not stated); use of alpha blockers and CCBs if needed; 2 L of 0.9% NaCI IV over 4 h; PAC >15.2 ng/dL after infusion for diagnosis of APA	NR	As above	As above; 2×2 table reconstructed based on reported sens. and spec., but the final numbers do not perfectly match because it is possible that not everybody received the SIT in the actual study (but details not provided)
Zhu, 2019 <sup>60</sup>	China	48.2 y, 166 M, 97 hypokalemia, ARR ≥25 ng/dL per ng/mL/h	Multi-gate with healthy and alternative diagnosis controls	Case-control	Prospective	110/ 313	CCT: discontinuation of diuretics × 4 weeks, and ACEI, ARB, and BB × 2 weeks; use of alpha blockers and CCBs if needed; supine × 2 h, then	Immuno- assay	Different standards used: PA based on ARR ≥25 ng/dL per ng/mL/h and PAC >12 ng/dL, plus at least one of the following abnormalities:	CCT was included both as the index test and part of the reference standard

							upright × 2 h for		(1) upright PRA	
							captopril 50 mg PO		<1.0 ng/ml/h, (2)	
							× 1 at 8-9 AM;		post-captopril

									defined as	surgery =
									normal BP	disease
									without needing	present;
									medications;	absent
1	1	1	1			1			mouloadono,	abaciii

									partial clinical success defined as same BP after surgery but needing less meds, or a reduction in BP with either same amount or less meds; absent clinical success defined by no change (or increase) in BP after surgery on same amount (or more) meds; those with complete/partial clinical success were defined to have verified unilateral PA	success = disease absent) with only APA included; 2×2 table reconstructed using table 4 and figure 3
Vivien, 2019 62	France	NR age, NR sex, NR hypokalemia, NR ARR	Single- gate	Consecutive	Prospective	44/120	SIT (recumbent): discontinuation of ACEI, ARB, central alpha agonists, direct renin inhibitors, and potassium-wasting diuretics, estrogen, and progesterone × 4 weeks, and potassium-sparing diuretics × 6 weeks; recumbent for 2 L of 0.9% NaCI IV over 4 h; PAC >160 pmol/L after infusion for diagnosis of PA	Immuno- assay	Different standards used: PA based on baseline ARR >64 pmol/L per mIU/L and positive confirmatory test by traditional criteria (i.e., post-SIT PAC >140 pmol/L, or CCT [captopril 50 mg × 1] with reduction in PAC by less than 30% after 2 hours)	SIT was included both as the index test and part of the reference standard
Fries, 2020 <sup>63</sup>	Germany	52.3 y, 37 M, 23 hypokalemia, NR ARR	Single- gate	Consecutive	Prospective	32/99	SIT (recumbent): discontinuation of mineralocorticoid receptor antagonists and potassium-sparing diuretics × 4 weeks, and ACEI, ARB, BB, and	HPLC- MS/MS	Unclear: clinical outcomes to targeted treatment as verification standard as adjudicated by panel of experienced	SIT was included both as the index test and part of the reference standard; even though this is a

Lin, 2020 <sup>64</sup>	China	48.3 y, 129 M,	Single-	Consecutive	Prospective	161/	direct renin inhibitors × 2 weeks; use of alpha blockers, CCBs, and vasodilators if needed; recumbent for 2 L of 0.9% NaCl IV over 4 h; PAC ≥140 pmol/L after infusion for diagnosis of PA	Immuno-	endocrinologists; PA based on all of the following: (1) elevated ARR (cut-offs not stated), (2) baseline PAC >550 pmol/L, (3) spontaneous hypokalemia, (4) either a suppressed renin <i>or</i> positive confirmatory test (i.e., post-SIT PAC ≥140 pmol/L, or post- CCT PAC reduction of ≤20%), and (5) cure/ improvement in BP and/or normalization of biochemistry after mineralocorti- coid receptor antagonist or surgery; implied that all others were classified as non-PA—but unclear if all patients, even those who had negative confirmatory testing, received entire verification process, including treatment Complete	single-gate design, risk of bias for patient selection was rated high because people who were indeterminate were excluded (i.e., "Failure to establish an unequivocal diagnostis criteria listed subsequently led to exclusion") and only patients with advanced features of PA were verified to have disease
		NR hypokalemia, ARR ≥3.7 ng/dL per mIU/L	gate			280	discontinuation of ACEI, ARB, BB, and diuretics (details not stated); use of alpha blockers and non-	assay	verification: FST as verification standard for PA vs. EH; PA based on positive FST	reconstructed using figure 1 and pre- determined PAC cut-off ≥10 ng/dL for

							dihydropyridine CCBs if needed; recumbent for 2 L of 0.9% NaCl IV over 4 h; PAC ≥10 ng/dL after infusion for diagnosis of PA		(fludrocortisone 0.6 mg PO q6h × 4 days; 10 AM post-FST PAC ≥8 ng/dL and "suppressed" renin and no rise in cortisol between 7 AM to 10 AM on the last day)	diagnosis of PA (rather than using table 3 that uses a different PAC cut-off)
Zhang, 2020 <sup>65</sup>	China	48.5 y, 46 M, 49 hypokalemia, ARR ≥30 ng/dL per ng/mL/h, or ARR ≥20 ng/dL per ng/mL/h plus PRA <1 ng/mL/h plus aldosterone >15 ng/dL	Single- gate	Consecutive	Prospective	90/110	SIT (recumbent): discontinuation of diuretics and spironolactone × 4 weeks, and ACEI, ARB, and BB × 2 weeks; use of alpha blockers and CCBs if needed; detailed protocol for SIT not stated (but assumed to be recumbent for 2 L of 0.9% NaCI IV over 4 h); PAC ≥12.04 ng/dL after infusion for diagnosis of PA	Immuno- assay	Different standards used: clinical diagnosis as verification standard (modified "4 corners approach") for PA vs. EH; APA based on a combination of all the following: (1) biochemical evidence of PA (details not stated, but likely included elevated ARR and post- recumbent SIT aldosterone >11.2 ng/dL [page 893]), plus (2) lateralization with AVS or NP59, plus (3) adenoma seen with cross- sectional imaging, surgery, or pathology, plus (4) cure of hypokalemia and improvement/ cure of hypertension after surgery; diagnosis of	SIT was included both as the index test and part of the reference standard; some patients were not accounted for (e.g., 3 patients with recumbent SIT); suspected error in the original report because sens. of 83.15% and spec. of 57% in figure 2 does not match the data from the text (i.e., true positives of 73 with false negatives of either 17 or 20); therefore, 2×2 table was reconstructed using data from the text because these raw

									bilateral (idiopathic) PA based on biochemical evidence of PA without lateralization; EH based on absence of criteria for PA— patients with negative confirmatory testing did not receive remainder of verification process, including treatment	numbers were the most clearly reported (and the reported sens. and spec. were ignored)
	China	48.5 y, 46 M, 49 hypokalemia, ARR ≥30 ng/dL per ng/mL/h, or ARR ≥20 ng/dL per ng/mL/h plus PRA <1 ng/mL/h plus aldosterone >15 ng/dL	Single- gate	Consecutive	Prospective	93/113	SIT (seated): discontinuation of diuretics and spironolactone $\times$ 4 weeks, and ACEI, ARB, and BB $\times$ 2 weeks; use of alpha blockers and CCBs if needed; detailed protocol for SIT not stated (but assumed to be seated for 2 L of 0.9% NaCI IV over 4 h); PAC $\ge$ 12.94 ng/dL after infusion for diagnosis of PA	Immuno- assay	As above	As above; the numbers cannot be replicated so 2×2 table was reconstructed using data from the text because these raw numbers were the most clearly reported
Liu, 2021 <sup>66</sup>	China	48.8 y, 88 M, NR hypokalemia, ARR ≥1.0 ng/dL per mIU/L	Single- gate	Consecutive	Prospective	196/ 269	SIT (seated): discontinuation of diuretics × 4 weeks, and ACEI, ARB, and BB × 2 weeks; use of alpha blockers and CCBs if needed; seated for 2 L of 0.9% NaCI IV starting at 8 AM over 4 h; PAC ≥12 ng/dL after infusion	Immuno- assay	Different standards used: PA based on either a positive FST (fludrocortisone $0.1 \text{ mg PO q6h} \times 4 \text{ days}; 10 \text{ AM}$ post-FST PAC $\geq 6 \text{ ng/dL}$ ) or, in the case of a negative FST (in 1 patient),	Extracted for diagnostic threshold associated with highest specificity with 12 ng/dL for SIT and 13 ng/dL for CCT

							for diagnosis of PA		subsequent adrenalectomy with complete biochemical success; EH based on absence of the criteria required for PA	
	China	48.8 y, 88 M, NR hypokalemia, ARR ≥1.0 ng/dL per mIU/L	Single- gate	Consecutive	Prospective	196/ 269	CCT: discontinuation of diuretics × 4 weeks, and ACEI, ARB, and BB × 2 weeks; use of alpha blockers and CCBs if needed; captopril 50 mg PO × 1 at 8-9 AM; PAC collected 2 h after captopril ≥13 ng/dL for diagnosis of PA	Immuno- assay	As above	As above
Fuss, 2021 <sup>67</sup>	Germany	52.6 y, 94 M, NR hypokalemia, ARR >20 ng/L per ng/L	Single- gate	Consecutive	Retrospective	103/ 187	SIT (recumbent): discontinuation of mineralocorticoid receptor antagonists × 4 weeks, and other antihypertensives × 1 week; use of alpha blockers and CCBs if needed; recumbent for 2 L of 0.9% NaCl IV starting at 8-10 AM over 4 h; PAC ≥140 ng/L (14.0 ng/dL) after infusion for diagnosis of PA	HPLC- MS/MS	Unclear: PA based on retrospective review of clinical factors including history, results of SIT by immunoassay with aldosterone >50 ng/L, imaging, AVS, pathology, and clinical response to treatment (surgery or medicine); unclear if every individual went through every single step for verification (e.g., including definitive treatment)	SIT was included both as the index test and part of the reference standard; although it was a single- gate study, risk of selection bias was high because 49 patients were excluded, including some where it was difficult to determine if disease was present

Data for the same subjects were sometimes reported across multiple articles. In these cases, the most recent or complete citation was used to avoid double counting the same subjects for the same test. **Abbreviations:** ACEI, angiotensin converting enzyme inhibitor; ARB, angiotensin receptor blocker; APA, aldosterone-producing adenoma; ARR, aldosterone-to-renin ratio; AVS; adrenal vein sampling; BB, beta-blocker; BP, blood pressure; CCB, calcium channel blocker; CCT, captopril challenge test; CI, confidence interval; CT,

computed tomography; DRC, direct renin concentration; EH, essential hypertension; FST, fludrocortisone suppression test; HPLC-MS/MS, high-performance liquid chromatography with tandem mass spectrometry; IM, intramuscularly; IV, intravenously; NaCI, sodium chloride; NP59, norcholesterol scan; NR, not reported; PA, primary aldosteronism; PAC, plasma aldosterone concentration; PO, *per os*, orally; PRA, plasma renin activity; SIT, intravenous saline infusion test; SLT, oral salt loading test; USA, United States of America; UK, United Kingdom.

For complete verification, all participants received the same reference test. For partial verification, a reference test was not applied to all participants. For different reference tests, different criteria are used to define participants. **Abbreviations:** BP, blood pressure; PA, primary aldosteronism.

**Table S6.** Summary of interpretation criteria used for the confirmatory tests.

Test	Laboratory measure	Thresholds used for diagnosis <sup>ref.</sup>
Intravenous	Post-infusion PAC	3.15 ng/dL (87 pmol/L) <sup>44</sup>

The reference category for all comparisons was "No." <sup>a</sup> Subgroup analysis was performed for each individual test provided that there were at least three studies in each stratum and the hierarchical summary receiver-operating characteristic meta-regression model could achieve successful convergence. Separate subgroup analyses were not performed for the seated SIT or oral SLT because there were only four studies and two studies, respectively, for each. <sup>b</sup> There were two studies that stated they enrolled consecutive patients even though they were based on a two-gate design <sup>37,40</sup>. **Abbreviations:** ARR, aldosterone-to-renin ratio; CCT, captopril challenge test; CI, confidence interval; FST, fludrocortisone suppression test; PA, primary aldosteronism; PAC, plasma aldosterone concentration; SIT, intravenous saline infusion test.

Figure S1. Preferred Reporting Items for Systematic Review and Meta-analysis (PRISMA) flow diagram.

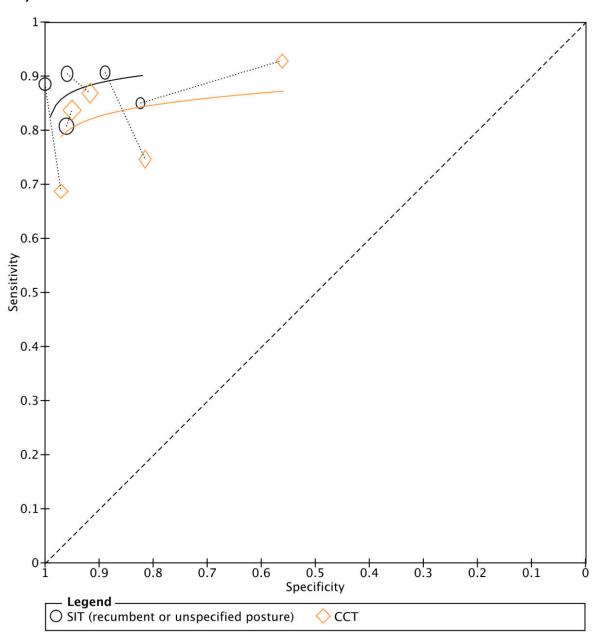

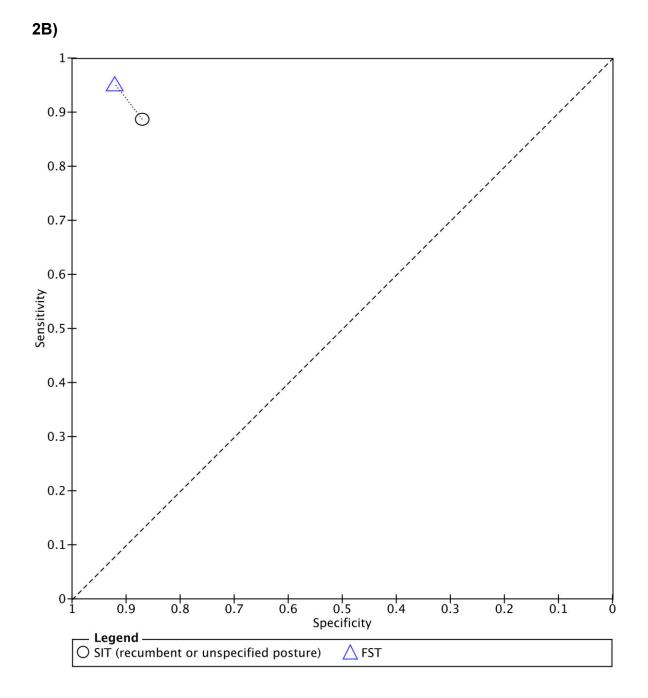

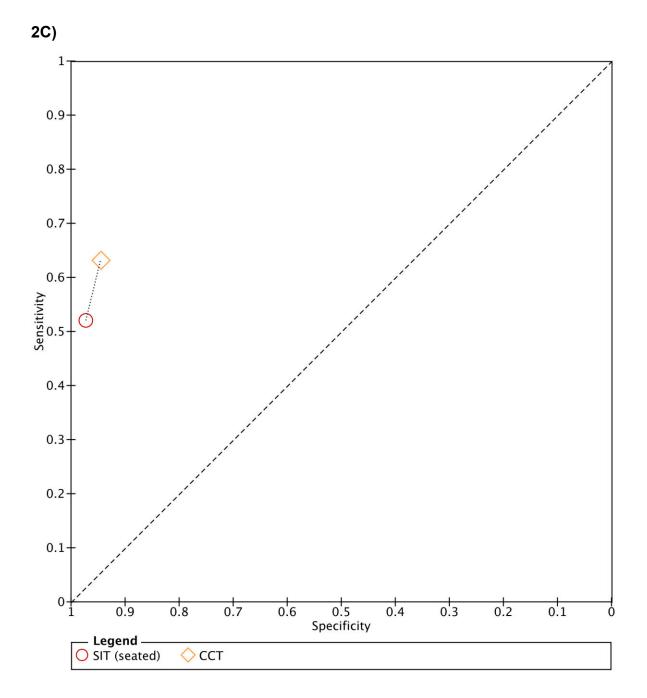

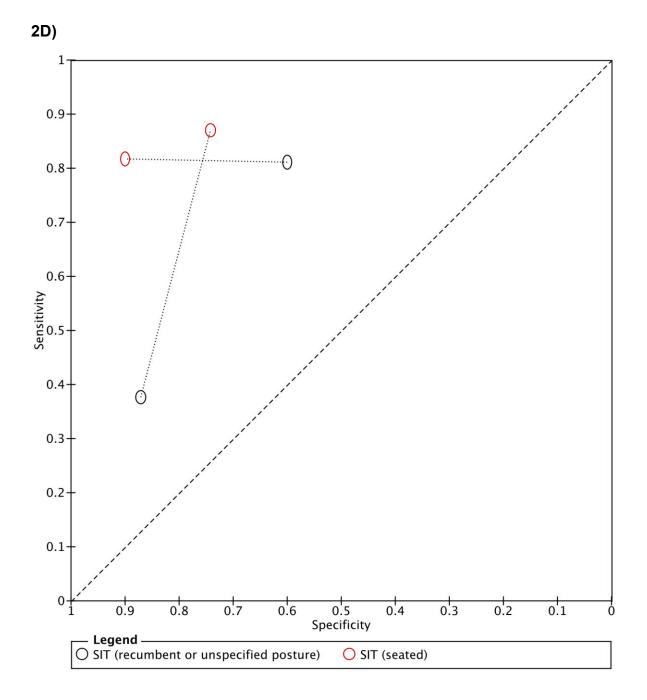

**Figure S3.** Summary receiver operating characteristics curves for studies that compared two confirmatory tests with a common reference standard (direct comparisons). There is a line joining tests that were compared. Curves were only plotted when there were more than 2 studies available. To avoid extrapolation beyond the data, the curves were drawn within the range of observed specificities. Comparisons were made for the recumbent SIT vs. CCT in 5 studies (**panel A**); recumbent SIT vs. FST in 1 study (**panel B**); seated SIT vs. CCT in 1 study (**panel C**); and recumbent SIT vs. seated SIT in 2 studies (**panel D**). **Abbreviations:** CCT, captopril challenge test; FST, fludrocortisone suppression test; SIT, intravenous saline infusion test.

2A)

**Figure S4.** Deeks' funnel plot and asymmetry test for publication bias for the intravenous recumbent saline infusion test, p=0.11 (**panel A**); seated saline infusion test, p=0.70 (**panel B**); fludrocortisone suppression test, p=0.38 (**panel C**); and captopril suppression test, p=0.42 (**panel D**). The oral salt loading test was not examined for publication bias because there were only two studies.

## 3A)
