Reporting Summary

Nature Research wishes to improve the reproducibility of the work that we publish. This form provides structure for consistency and transparency in reporting. For further information on Nature Research policies, see our <u>Editorial Policies</u> and the <u>Editorial Policy Checklist</u>.

C+	հ†i	ict	ics
$\mathcal{I}_{\mathcal{L}_{0}}$	a u	IJι	ıcs

For all statistical a	analyses, confirm that the following items are present in the figure legend, table legend, main text, or Methods section.				
n/a Confirmed					
☐ ☐ The exac	ct sample size (n) for each experimental group/condition, given as a discrete number and unit of measurement				
A staten	nent on whether measurements were taken from distinct samples or whether the same sample was measured repeatedly				
The stat	istical test(s) used AND whether they are one- or two-sided mon tests should be described solely by name; describe more complex techniques in the Methods section.				
A descri	ption of all covariates tested				
A descri	ption of any assumptions or corrections, such as tests of normality and adjustment for multiple comparisons				
☐ ☐ A full de AND var	scription of the statistical parameters including central tendency (e.g. means) or other basic estimates (e.g. regression coefficient) iation (e.g. standard deviation) or associated estimates of uncertainty (e.g. confidence intervals)				
For null Give P va	hypothesis testing, the test statistic (e.g. F , t , r) with confidence intervals, effect sizes, degrees of freedom and P value noted lues as exact values whenever suitable.				
For Baye	For Bayesian analysis, information on the choice of priors and Markov chain Monte Carlo settings				
For hier	archical and complex designs, identification of the appropriate level for tests and full reporting of outcomes				
Estimate	es of effect sizes (e.g. Cohen's d, Pearson's r), indicating how they were calculated				
Our web collection on <u>statistics for biologists</u> contains articles on many of the points above.					
Software a	nd code				
Policy information	n about <u>availability of computer code</u>				
Data collection	The web-based questionnaires used for data collection were created in SurveyXact (www.surveyxact.dk). The SurveyXact system is used directly online and no version number exist.				
Data analysis	All data analysis, validation and management was conducted in R (version 4.0.2). The R packages "riskCommunicator" (v1.0.1) and "Forester" (v.0.5.0) were used.				
•	ng custom algorithms or software that are central to the research but not yet described in published literature, software must be made available to editors and y encourage code deposition in a community repository (e.g. GitHub). See the Nature Research guidelines for submitting code & software for further information.				

Data

Policy information about <u>availability of data</u>

All manuscripts must include a data availability statement. This statement should provide the following information, where applicable:

- Accession codes, unique identifiers, or web links for publicly available datasets
- A list of figures that have associated raw data
- A description of any restrictions on data availability

Health data are considered person-sensitive, and cannot be shared due to data protection regulations.

Field-specific reporting

Please select the one belo	ow tha	it is the best fit for your research.	f yc	ou are not sure, read the appropriate sections before making your selection.	
X Life sciences		Behavioural & social sciences		Ecological, evolutionary & environmental sciences	

 $For a \ reference\ copy\ of\ the\ document\ with\ all\ sections, see\ \underline{nature.com/documents/nr-reporting-summary-flat.pdf}$

Life sciences study design

All studies must disclose on these points even when the disclosure is negative.

Sample size

The sample size for cases was indirectly determined by the length of the study period, since all eligible individuals tested positive for SARS-CoV-2 during this period were invited to participate. The beginning of the study period were determined by when community testing, became widely used, also among individuals without symptoms, and the end of the study period were determined by, when we had invited all subjects where 6, 9 or 12 months had elapsed since infection. Based on previous experiences of lower response rates among control persons than cases, e.g. during outbreak investigations, a case:control ratio of 2:3 was selected.

Data exclusions

Questionnaires from 532 supposedly never infected control persons were excluded, due to these persons reported having antibodies against SARS-CoV-2 detected in a blood sample, and thereby having been infected at an earlier point in time

Replication

The present study is a questionnaire survey and has not been replicated as suc Instead, we have compared our results from other sources and found them reasonably similar. Very similar questionnaires are used in an ongoing longitudinal study, however results will not be 100% comparable due to changes over time in predominating SARS-CoV-2 variants circulating in the population. An English translation of the questionnaire has been made available in supplementary materials - free to use for others who might be interesting in repeating the survey

Randomization

All cases receiving a positive PCR result within the study period were invited to participate, control persons were selected among persons receiving a negative PCR result, date matched in a case:control ratio of 2:3

Blinding

Blinding was not relevant, since this is an observational study, where partcipants were invited based on test status (case or control).

Behavioural & social sciences study design

All studies must disclose on these points even when the disclosure is negative.

Study description

Briefly describe the study type including whether data are quantitative, qualitative, or mixed-methods (e.g. qualitative cross-sectional, quantitative experimental, mixed-methods case study).

Research sample

State the research sample (e.g. Harvard university undergraduates, villagers in rural India) and provide relevant demographic information (e.g. age, sex) and indicate whether the sample is representative. Provide a rationale for the study sample chosen. For studies involving existing datasets, please describe the dataset and source.

Sampling strategy

Describe the sampling procedure (e.g. random, snowball, stratified, convenience). Describe the statistical methods that were used to predetermine sample size OR if no sample-size calculation was performed, describe how sample sizes were chosen and provide a rationale for why these sample sizes are sufficient. For qualitative data, please indicate whether data saturation was considered, and what criteria were used to decide that no further sampling was needed.

Data collection

Provide details about the data collection procedure, including the instruments or devices used to record the data (e.g. pen and paper, computer, eye tracker, video or audio equipment) whether anyone was present besides the participant(s) and the researcher, and whether the researcher was blind to experimental condition and/or the study hypothesis during data collection.

Timing

Indicate the start and stop dates of data collection. If there is a gap between collection periods, state the dates for each sample cohort.

Data exclusions

If no data were excluded from the analyses, state so OR if data were excluded, provide the exact number of exclusions and the rationale behind them, indicating whether exclusion criteria were pre-established.

Non-participation

 $State\ how\ many\ participants\ dropped\ out/declined\ participation\ and\ the\ reason(s)\ given\ OR\ provide\ response\ rate\ OR\ state\ that\ no\ participants\ dropped\ out/declined\ participation.$

Randomization

If participants were not allocated into experimental groups, state so OR describe how participants were allocated to groups, and if allocation was not random, describe how covariates were controlled.

Ecological, evolutionary & environmental sciences study design

II studies must disclose or	n these points even when the disclosure is negative.				
Study description	Briefly describe the study. For quantitative data include treatment factors and interactions, design structure (e.g. factorial, nested, hierarchical), nature and number of experimental units and replicates.				
Research sample	Describe the research sample (e.g. a group of tagged Passer domesticus, all Stenocereus thurberi within Organ Pipe Cactus National Monument), and provide a rationale for the sample choice. When relevant, describe the organism taxa, source, sex, age range and any manipulations. State what population the sample is meant to represent when applicable. For studies involving existing datasets, describe the data and its source.				
Sampling strategy	Note the sampling procedure. Describe the statistical methods that were used to predetermine sample size OR if no sample-size calculation was performed, describe how sample sizes were chosen and provide a rationale for why these sample sizes are sufficient.				
Data collection	Describe the data collection procedure, including who recorded the data and how.				
Timing and spatial scale	Indicate the start and stop dates of data collection, noting the frequency and periodicity of sampling and providing a rationale for these choices. If there is a gap between collection periods, state the dates for each sample cohort. Specify the spatial scale from which the data are taken				
Data exclusions	If no data were excluded from the analyses, state so OR if data were excluded, describe the exclusions and the rationale behind them, indicating whether exclusion criteria were pre-established.				
Reproducibility	Describe the measures taken to verify the reproducibility of experimental findings. For each experiment, note whether any attempts to repeat the experiment failed OR state that all attempts to repeat the experiment were successful.				
Randomization	Describe how samples/organisms/participants were allocated into groups. If allocation was not random, describe how covariates were controlled. If this is not relevant to your study, explain why.				
Blinding	Describe the extent of blinding used during data acquisition and analysis. If blinding was not possible, describe why OR explain why blinding was not relevant to your study.				
Did the study involve fiel	d work? Yes No				
ield work collec	tion and transport				
Field conditions	Describe the study conditions for field work, providing relevant parameters (e.g. temperature, rainfall).				
Location	State the location of the sampling or experiment, providing relevant parameters (e.g. latitude and longitude, elevation, water depth).				
Access & import/export	Describe the efforts you have made to access habitats and to collect and import/export your samples in a responsible manner and in compliance with local, national and international laws, noting any permits that were obtained (give the name of the issuing authority, the date of issue, and any identifying information).				
Disturbance	Describe any disturbance caused by the study and how it was minimized.				
<u> </u>	r specific materials, systems and methods				
•	authors about some types of materials, experimental systems and methods used in many studies. Here, indicate whether each material evant to your study. If you are not sure if a list item applies to your research, read the appropriate section before selecting a response.				
Materials & experime	ental systems Methods				
/a Involved in the study					
Antibodies Eukaryotic cell lines					
Palaeontology and a					
Animals and other o					
Human research pa	rticipants				
Clinical data					
Dual use research o	f concern				

Antibodies

Antibodies used

Describe all antibodies used in the study; as applicable, provide supplier name, catalog number, clone name, and lot number.

Validation

Describe the validation of each primary antibody for the species and application, noting any validation statements on the manufacturer's website, relevant citations, antibody profiles in online databases, or data provided in the manuscript.

Eukaryotic cell lines

Policy information about cell lines

Cell line source(s)

State the source of each cell line used.

Authentication

Describe the authentication procedures for each cell line used OR declare that none of the cell lines used were authenticated.

Mycoplasma contamination

Confirm that all cell lines tested negative for mycoplasma contamination OR describe the results of the testing for mycoplasma contamination OR declare that the cell lines were not tested for mycoplasma contamination.

Commonly misidentified lines (See ICLAC register)

 $Name\ any\ commonly\ misidentified\ cell\ lines\ used\ in\ the\ study\ and\ provide\ a\ rationale\ for\ their\ use.$

Palaeontology and Archaeology

Specimen provenance

Provide provenance information for specimens and describe permits that were obtained for the work (including the name of the issuing authority, the date of issue, and any identifying information).

Specimen deposition

Indicate where the specimens have been deposited to permit free access by other researchers.

Dating methods

If new dates are provided, describe how they were obtained (e.g. collection, storage, sample pretreatment and measurement), where they were obtained (i.e. lab name), the calibration program and the protocol for quality assurance OR state that no new dates are provided.

Tick this box to confirm that the raw and calibrated dates are available in the paper or in Supplementary Information.

Ethics oversight

Identify the organization(s) that approved or provided guidance on the study protocol, OR state that no ethical approval or guidance was required and explain why not.

Note that full information on the approval of the study protocol must also be provided in the manuscript.

Animals and other organisms

Policy information about studies involving animals; ARRIVE guidelines recommended for reporting animal research

Laboratory animals

For laboratory animals, report species, strain, sex and age OR state that the study did not involve laboratory animals.

Wild animals

Provide details on animals observed in or captured in the field; report species, sex and age where possible. Describe how animals were caught and transported and what happened to captive animals after the study (if killed, explain why and describe method; if released, say where and when) OR state that the study did not involve wild animals.

Field-collected samples

For laboratory work with field-collected samples, describe all relevant parameters such as housing, maintenance, temperature, photoperiod and end-of-experiment protocol OR state that the study did not involve samples collected from the field.

Ethics oversight

Identify the organization(s) that approved or provided guidance on the study protocol, OR state that no ethical approval or guidance was required and explain why not.

Note that full information on the approval of the study protocol must also be provided in the manuscript.

Human research participants

Policy information about studies involving human research participants

Population characteristics

The participants consisted of 93,494 females (61.2%) and 59,386 males (38.8%) with median ages of 50 years (IQRs: 36, 60) and 54 years (IQRs: 41, 64), respectively. Compared to test-negative participants, test-positives were more often: males, younger, students or having full-time employment, and more physically active, and less often: pensioners or smokers (please see table 1 for more details).

Recruitment

As mentioned previously, all individuals living i Denmark aged 15-years or above, who received a positive PCR test result for the first time within the relevant period and had access to the national digital communication systems eBoks (used by 92% of this agegroup) were invited to participate along with date-matched test-negative controls (randomly selected to fit a case:control ratio of 2:3). Participation was voluntary and no rewards were given. Potentially, test-positives who experience post-acute symptoms might be more likely to participate, than test-positives where this is not the case, leading to potential overestimation of the prevalence of symptoms. However, since response rates among test-positive cases and test-negative

control-persons (who also have no specific motivation for taking part) were very similar, we do not believe that this is a huge source of bias.

Ethics oversight

This study was performed as a surveillance study as part of the governmental institution Statens Serum Institut's (SSI) advisory tasks for the Danish Ministry of Health. SSI's purpose is to monitor and fight the spread of disease in accordance with section 222 of the Danish Health Act. According to Danish law national surveillance activities conducted by SSI does not require approval from an ethics committee. It was approved by the Danish Governmental law firm and SSI's compliance department that the study is fully compliant with all legal, ethical and IT-security requirements and there are no further approval procedures regarding such studies.

Note that full information on the approval of the study protocol must also be provided in the manuscript.

	ChIP-seq					

Data deposition

May remain private before publication.

Confirm that both raw and f	nal processed data have been deposited in a public database such as <u>GEO</u> .	
Confirm that you have depor	sited or provided access to graph files (e.g. BED files) for the called peaks.	
Data access links	For "Initial submission" or "Revised version" documents, provide reviewer access links	For your "Final submission" document

provide a link to the deposited data.

Files in database submission

Provide a list of all files available in the database submission.

Genome browser session (e.g. UCSC)

Provide a link to an anonymized genome browser session for "Initial submission" and "Revised version" documents only, to enable peer review. Write "no longer applicable" for "Final submission" documents.

Methodology

Replicates Describe the experimental replicates, specifying number, type and replicate agreement.

Sequencing depth Describe the sequencing depth for each experiment, providing the total number of reads, uniquely mapped reads, length of reads and

whether they were paired- or single-end.

Antibodies Describe the antibodies used for the ChIP-seq experiments; as applicable, provide supplier name, catalog number, clone name, and lot

numbe

Peak calling parameters | Specify the command line program and parameters used for read mapping and peak calling, including the ChIP, control and index files

used.

Data quality Describe the methods used to ensure data quality in full detail, including how many peaks are at FDR 5% and above 5-fold enrichment.

Software Describe the software used to collect and analyze the ChIP-seq data. For custom code that has been deposited into a community

repository, provide accession details.

Flow Cytometry

М	U	เร		

Methodology

Sample preparation Describe the sample preparation, detailing the biological source of the cells and any tissue processing steps used.

Instrument Identify the instrument used for data collection, specifying make and model number.

Software Describe the software used to collect and analyze the flow cytometry data. For custom code that has been deposited into a

community repository, provide accession details.

Cell population abundance Describe the abundance of the relevant cell populations within post-sort fractions, providing details on the purity of the

samples and how it was determined.

Gating strategy

Describe the gating strategy used for all relevant experiments, specifying the preliminary FSC/SSC gates of the starting cell

population, indicating where boundaries between "positive" and "negative" staining cell populations are defined.

Tick this box to confirm that a figure exemplifying the gating strategy is provided in the Supplementary Information.

Magnetic resonance imaging

Experimental design

Design type Indicate task or resting state; event-related or block design.

Design specifications

Specify the number of blocks, trials or experimental units per session and/or subject, and specify the length of each trial

or block (if trials are blocked) and interval between trials.

Behavioral performance measures

State number and/or type of variables recorded (e.g. correct button press, response time) and what statistics were used to establish that the subjects were performing the task as expected (e.g. mean, range, and/or standard deviation across subjects).

Acquisition						
Imaging type(s)		Specify: functional, structural, diffusion, perfusion.				
Field strength	Specify	in Tesla				
Sequence & imaging parameters		the pulse sequence type (gradient echo, spin echo, etc.), imaging type (EPI, spiral, etc.), field of view, matrix size, ickness, orientation and TE/TR/flip angle.				
Area of acquisition	State v	whether a whole brain scan was used OR define the area of acquisition, describing how the region was determined.				
Diffusion MRI Used	☐ No	Not used				
Preprocessing						
Preprocessing software		ail on software version and revision number and on specific parameters (model/functions, brain extraction, on, smoothing kernel size, etc.).				
Normalization		normalized/standardized, describe the approach(es): specify linear or non-linear and define image types used for ion OR indicate that data were not normalized and explain rationale for lack of normalization.				
Normalization template		e template used for normalization/transformation, specifying subject space or group standardized space (e.g. nirach, MNI305, ICBM152) OR indicate that the data were not normalized.				
Noise and artifact removal		ur procedure(s) for artifact and structured noise removal, specifying motion parameters, tissue signals and all signals (heart rate, respiration).				
Volume censoring Define your software and/or method and criteria for volume censoring, and state the extent of such censoring						
Statistical modeling & infere	ence					
		(mass univariate, multivariate, RSA, predictive, etc.) and describe essential details of the model at the first and s (e.g. fixed, random or mixed effects; drift or auto-correlation).				
Effect(s) tested		ecise effect in terms of the task or stimulus conditions instead of psychological concepts and indicate whether r factorial designs were used.				
Specify type of analysis: W	/hole brain	ROI-based Both				
Statistic type for inference (See <u>Eklund et al. 2016</u>)	Specify voxe	l-wise or cluster-wise and report all relevant parameters for cluster-wise methods.				
Correction	Describe the type of correction and how it is obtained for multiple comparisons (e.g. FWE, FDR, permutation or Monte Carlo					
Models & analysis						
n/a Involved in the study Functional and/or effective Graph analysis Multivariate modeling or p	,					
Functional and/or effective conr	nectivity	Report the measures of dependence used and the model details (e.g. Pearson correlation, partial correlation, mutual information).				
Graph analysis		Report the dependent variable and connectivity measure, specifying weighted graph or binarized graph, subject- or group-level, and the global and/or node summaries used (e.g. clustering coefficient, efficiency,				

Multivariate modeling and predictive analysis

etc.).

Specify independent variables, features extraction and dimension reduction, model, training and evaluation metrics.
