## Statistical Summary Document

<b>Manuscript Title:</b>	Functional characterization of Atlantic salmon ( <i>Salmo salar L.</i> ) PepT2 transporters									
<b>Authors:</b>	Francesca Vacca, Ana S. Gomes, Koji Murashita, Raffella Cinquetti, Cristina Roseti, Amilcare Barca, Ivar Rønnestad, Tiziano Verri, Elena Bossi									
<b>Animal model used, if applicable:</b>	<i>Xenopus laevis</i> oocytes, <i>Salmon salar</i>									
<b>Underlying hypothesis:</b>	This investigation tests the hypothesis that both salmon transporter (PepT2a and PepT2b) are pH-dependent. Moreover, it tests if one of the two proteins characterized is more pH-dependent than the other. With the comparison, we have verified if in PepT2a the increasing of the pH has more impact on the reduction of the transport associated current respect to PepT2b.									
<b>Definitions of 'n':</b>	"n" is the number of oocytes; N is the number of the batches									
<b>Statistical summary table:</b>										

Experimental question number	Finding/ conclusion	Experimental location/variable	Mean value	Units	Standard Deviation	n/N	Figure/table in which data are presented	Data comparisons	Statistical test	Any other experimental factors	Comments	
Is PepT2a inward current magnitude different between pH 5.5 and pH 6.5?	The inward currents at pH 5.5 and at pH 6.5 are different	pH 5.5	-685.04829	nA	179.34 367	18/4	0.0003 213770	Fig 5 and Fig. 6	pH 5.5 vs pH 6.5	Mann Whitney test	Vh= -120 mV	At level 0.05, the two distributions are significantly different
