eFigure 1. Distribution of the mean item score on the Everyday Discrimination Scale (modeled as the mean item score, ranging from 0 = *Never* to 3 = *Almost every day*) among participants who reported everyday discrimination ($N_{\text{respondent}} = 35,844$), stratified by survey timing and self-reported race and ethnicity.

(a) Mean ratings on the Everyday Discrimination Scale[‡] by survey timing and self-reported race and ethnicity.

[‡] An open diamond shape indicates a mean value for a given stratum of self-reported race and ethnicity at a given survey timing.

(b) Distribution of main reason(s) for everyday discrimination by survey timing and self-reported race and ethnicity[‡].

[‡]We collapsed the five subgroups of participants self-identifying as Hispanic or Latino into a single group due to limited sample size.

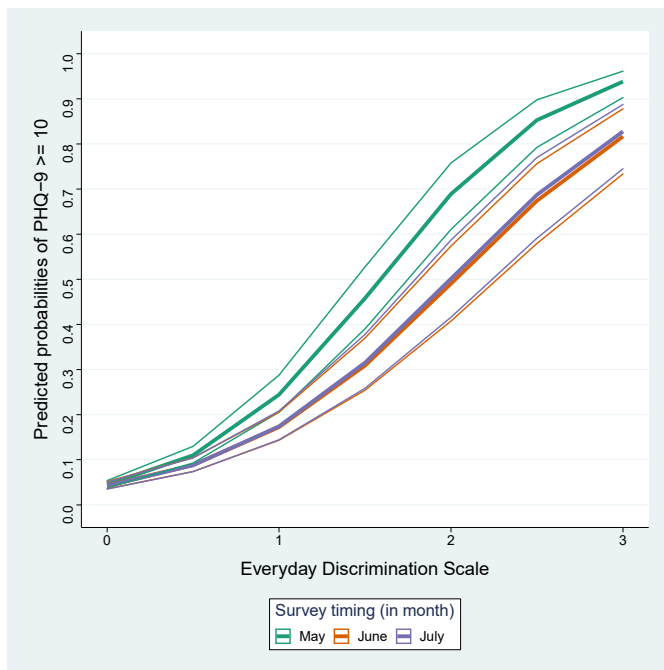

eFigure 2. Variations in the associations of everyday discrimination (modeled as the mean item score, ranging from 0 = *Never* to 3 = *Almost every day*) with moderate to severe depressive symptoms and suicidal ideation by survey timing, estimated from mixed-effects models. Numeric estimates from the mixed-effect logistic regression models can be found in **eTable 4**.

Target outcome: Moderate to severe depressive symptoms (PHQ-9 total score ≥ 10)

(a) Everyday discrimination due to any reason

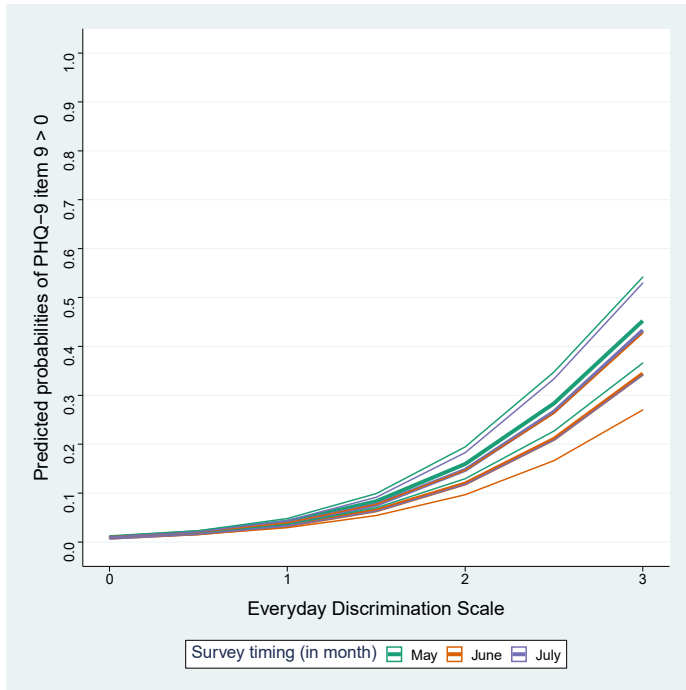

(b) Everyday discrimination due to race, ancestry, or national origin

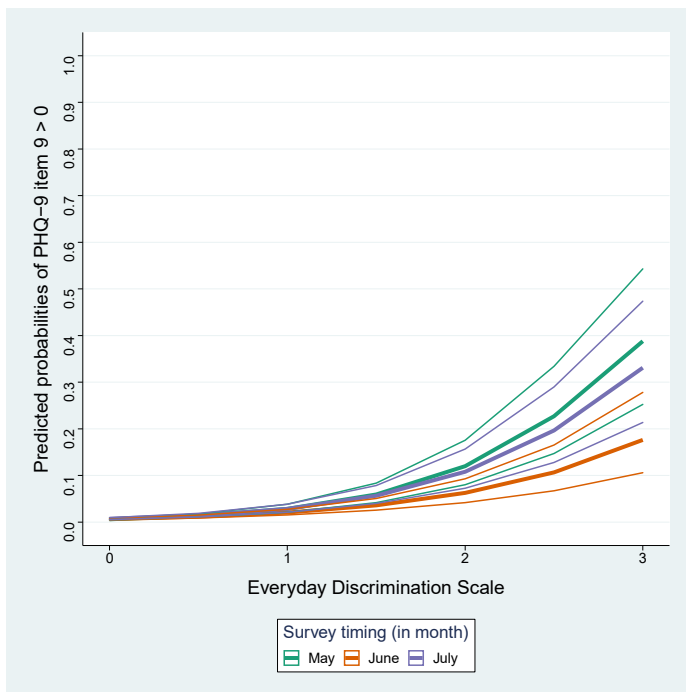

Target outcome: Suicidal ideation (PHQ-9 item 9 > 0)

(c) Everyday discrimination due to any reason

(d) Everyday discrimination due to race, ancestry, or national origin

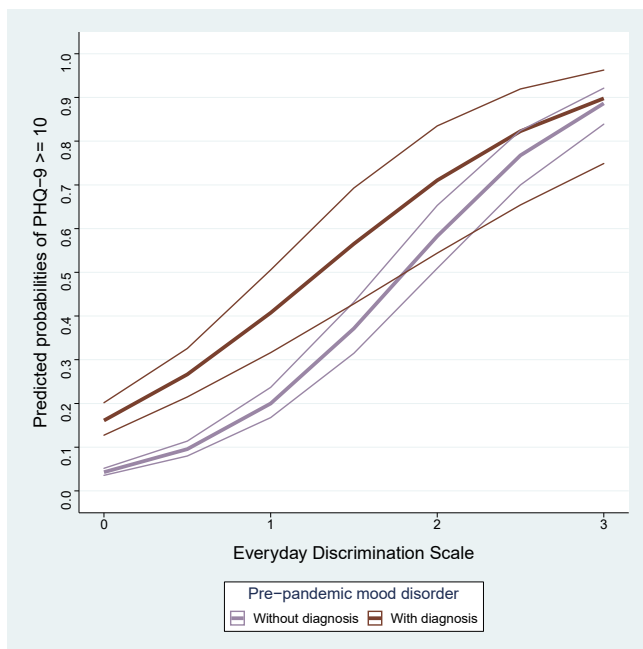

eFigure 3. Variations in the associations of everyday discrimination (modeled as the mean item score, ranging from 0 = *Never* to 3 = *Almost every day*) with moderate to severe depressive symptoms and suicidal ideation by prepandemic mood disorder diagnosis, estimated from mixed effect models. Numeric estimates from the mixed-effect logistic regression models can be found in **eTable 5**.

Target outcome: Moderate to severe depressive symptoms (PHQ-9 total score ≥ 10)

(a) Everyday discrimination due to any reason

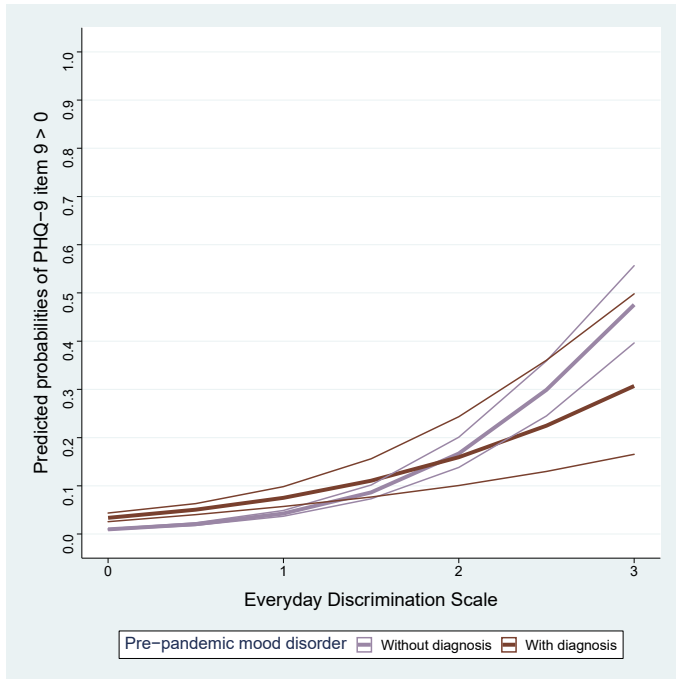

(b) Everyday discrimination due to race, ancestry, or national origin

Target outcome: Suicidal ideation (PHQ-9 item 9 > 0)

(c) Everyday discrimination due to any reason

(d) Everyday discrimination due to race, ancestry, or national origin

eMethods.

Cohort description

To date, the *All of Us* Research Program (hereafter, AoU) has enrolled more than 400,000 participants, of which more than 80% are individuals from communities that have been underrepresented in biomedical research, such as people identifying as Asian, Black or African American, Hispanic or Latino race and ethnicity, LGBTQ+ sexual orientation and gender identities, and those with less than high school education or household incomes at the federal poverty level (1). The diversity of the AoU cohort provides a unique opportunity to examine the impact of discrimination on mental health outcomes and its potential variations across sociodemographic and environmental contexts (2). However, the AoU Research Program currently administers the consent form and questionnaires in either English or Spanish, potentially limiting participation by those with limited proficiency in those languages.

Extraction of prepandemic mood disorder diagnosis

In the *All of Us* Research Program, electronic health records (EHRs) were available from a subset of participants who authorized linkage of electronic health records by signing the HIPAA Authorization for Research EHR/Part 2 Supplement Form (3,4). In the current study, we used these linked EHRs to establish whether respondents had a prepandemic history of mood disorder. Participants were considered as cases if they had two or more qualifying diagnostic codes (identified based on Systematized Nomenclature of Medicine (SNOMED) code 46206005) within one year prior to January 21st, 2020—the date of the first reported COVID-19 case in the United States (5). Of 62,551 participants in the study sample, 40,438 (64.6%) had linked EHRs, and those who did not meet the criteria or, to be conservative, did not have linked EHRs were considered as non-cases.
