Do-file Commands

** Non operative X operative management of acute appendicitis **

** analysis run by Rodrigo Moises de Almeida Leite, november 2 2021, stata version 17 **

** the APPAC trial, JAMA, 2015. The overall complication rate of 2.8% (95% CI, 1.0%- 6.0%) was significantly lower in the antibiotic group (6/216 patients) than the overall rate of 20.5% (95% CI, 15.3%-26.4%) in the surgical group (45/220 patients). There was a difference between groups of 17.7% (95% CI, 11.9%-23.4%) for the overall complication rate (P < .001)

csi 7 56 250 217

** Styrud et al, they claim 16 patients among 128 in antibiotics group had complications in 1 year follow up, and 17 among 124 in surgery group.

csi 16 17 112 107

** COMMA trial. The authors report a 74.4% percentage treatment success at 12 months at the antibiotics group (72 among 91) and report 5 cases of treatment failure (4 patients developed postoperative collection, 1 patient developed umbilical port site infection) among 89 patients

csi 84 72 5 19

** CODDA collaborative trial . The authors claim that the rate for treatment success at 30 days was 462/676(68) in the antibiotics group and 466/663(70) in the surgery group.

csi 462 466 214 197

** Vons et al. The primary endpoint (rate of peritonitis at 30 days follow up) was for 9 in 120 (antibiotic group) and 2 in 117 in the surgery group.

csi 9 2 111 117

** Eriksson et al. Rates of complication were 7 in 20 (antibiotic group) and 1 in 20 in surgery group

csi 7 1 13 19

** ASAA trial, Ceresoli et al. The primary outcome (success of treatment) was 16 in 19 for antibiotics group and 22 in 22 in surgery group.

csi 16 22 3 0

**Hansson et al. Major complications within a median of 1 year were 11 in 202 in antibiotic group and 18 in 167 in surgery group

**Logarithmic transformation of the Risk Ratios

** Secondary Outcome : Rate of Serious Adverse Effects

New england Journal of medicine trial : the authors claim total rate of serious adverse effects was 27 in 676 in the antibiotics group, and 19 in 656 in surgery group.

csi 27 19 649 637

ASAA trial : the authors claim that secondary negative outcomes happened in 1 in 26 patients in antibiotic group and in 5 of 22 patients in surgery group.

csi 1 5 15 17

Vons et al : the authors claim there were 12 cases of complication in the antibiotics group (2 wound infection, 1 intestinal adhesion and 9 cases of peritonitis) in 119 patients. In surgery group there were 3 cases of complications (1 wound infection and 2 peritonitis).

csi 12 3 107 117

Eriksson et al : the authors did not report the rate of serious adverse effects.

Hansson et al : the authors reply that the rate of major complications at 1 year in the intention to treat population were 11 202 in antibiotics group and 18 in 167 in surgery group

csi 11 18 191 149

The Comma trial : the authors did not report the rate of serious adverse effects.

The APPAC trial : the authors report a complication rate of 6 in 216 in the antibiotic group and 45 in 220 in the surgical group

csi 6 45 210 175

Styrud et al : the authors report that complications occurred in 31 patients in 128 in the antibiotic group (15 need for operation and 16 recurrence) and in 17 in 124 patients in surgery groups (mainly wound infections)

csi 31 17 97 107
