

Supplementary figure S4.

Expansion of peripheral blood T-cell clones, by response to ivuxolimab.

Number of unique TCR- β clones per 100,000 with a significant increase in frequency from baseline to week 6 (y-axis) is depicted in patients grouped by RECIST response (x-axis). Significance was determined after applying a Benjamini-Hochberg multiple testing correction to all P values with an α threshold of 1%.

PD, progressive disease; PR, partial response; SD, stable disease; TCR, T-cell receptor
