

Supplementary Figure S1:

Supplementary Figure S1. A. PFS and OS percent survival stratified by pre-treatment evenness high and low patients (n=22), TMB (n=29) and PD-L1 (n=28). **B.** Correlation between evenness in pre-T tissue samples and TMB or PD-L1 (Evenness vs TMB: n=20; CPR, n=9; non-CPR, n=8; non-resected, n=3. Evenness vs PD-L1: n=21; CPR, n=10; non-CPR, n=8; non-resected, n=3). The black line indicates the linear regression line, and the dotted lines indicate the upper and lower boundaries of the 95% confidence interval. Each patient is represented by a green (CPR), purple (non-CPR) or grey (non-resected) dot. **C.** Characterization of the entire TCR-sequenced cohort based on their top 1% clonal space in pre-T tissue, mutations and pathological response (n=22).
