

Supplementary materials

Table S1 Consistency of MMR-IHC and MSI testing

	MSS	MSI-H/L	Total	Kappa
pMMR	246 (98.4%)	4 (1.6%)	250	0.758
dMMR	75 (18.5%)	331 (81.5%)	452	
Total	321	335	656	

MMR, mismatch repair; dMMR, deficient MMR; pMMR, proficient MMR; MSI, microsatellite instability; MSI-H, MSI-high; MSI-L, MSI-low; MSS, microsatellite stability.

Table S2 Germline variants of MMR genes detected by NGS and Sanger sequencing

Patient	Age (years)	Stage	Gene	Variant	Pathogenicity	Sanger sequencing	LS/sporadic CRCs	MMR_IHC	MSI

MMR, mismatch repair; MSI, microsatellite instability; PPV, positive predictive value; NPV, negative predictive value.

Figure S1 Comparison of gene variant frequencies in groups with different clinical features. (A–D) Cancer associated genes with significantly different variant frequencies in groups with different ages, clinical stages, tumor locations, and degrees of differentiation. Each row represents a gene, each column represents a sample, and colors represent types of variants.

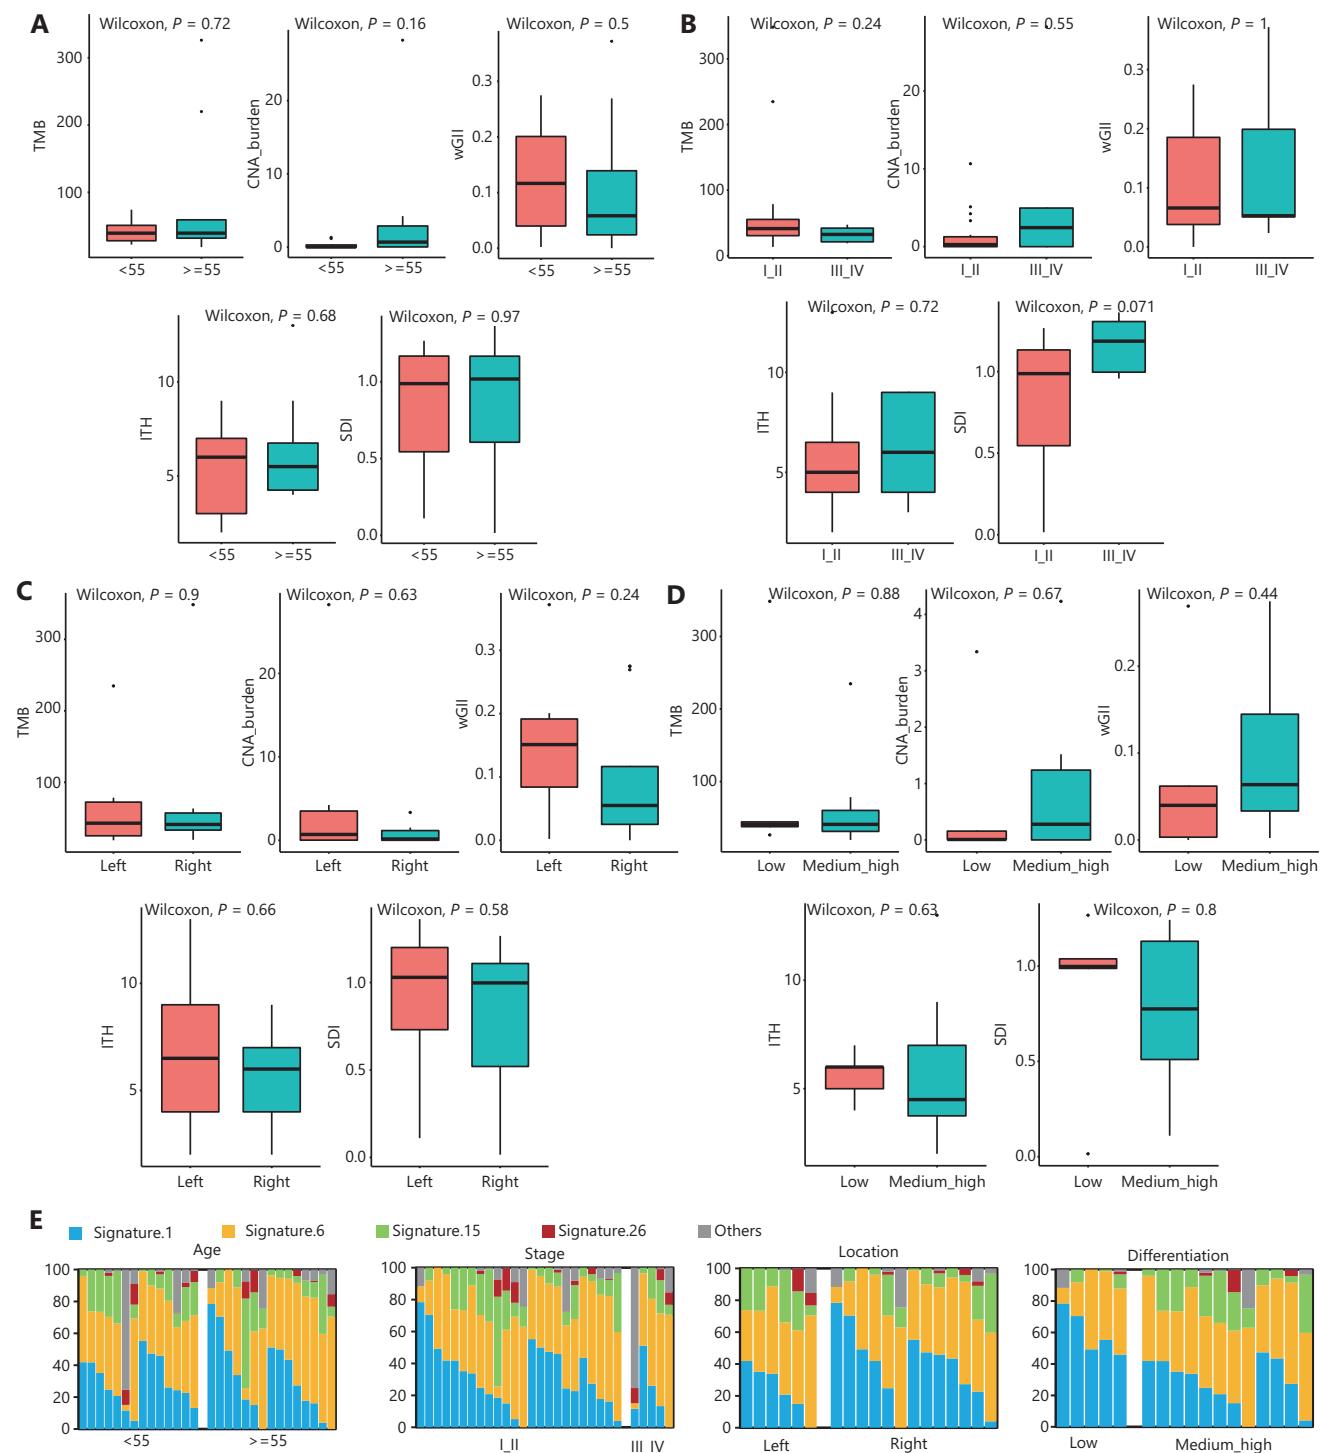

Figure S2 Comparison of genetic features in groups with different clinical features. (A) TMB, CNV burden, wGII, ITH index, and SDI in groups with different ages. (B) TMB, CNV burden, wGII, ITH index, and SDI in groups with different clinical stages. (C) TMB, CNV burden, wGII, ITH index, and SDI in groups with different tumor locations. (D) TMB, CNV burden, wGII, ITH index, and SDI in groups with different degrees of differentiation. (E) Mutational signatures in groups with different ages, clinical stages, tumor locations, and degrees of differentiation.
