

2 **Supplementary Figure S1. Levels of EPN-2, TPP1, HNRNPD, but not MFGE8 are**
3 **reduced upon expression of CTSW.** (A-B) Original blots from figure 2E are shown. Blots
4 were first stained against the tag of the candidates (top blots), then for CTSW and GAPDH
5 (lower blots). Blots in (B) contain four lanes in the middle that are not relevant to data
6 shown in figure 2E. (C) Band intensities for the target proteins were quantified from
7 multiple independent blots, normalized to GAPDH levels and are given relative to the
8 GFP-expressing control. Grey bars depict relative intensities from GFP-expressing cells
9 (set to 1), red bars show relative intensities for CTSW-expressing cells. Black dots
10 represent results from mock infected cells, white dots from infected cells. Error bars
11 display standard deviation.
