Supplemental Figures

Supplementary Fig 1. Molecular Simulation for The Identify of mouse sRANKL Selective Binding Pocket.

a The distance change between residues of Y234- H224, K180-H224, Y234-D301, Q236-R222, K180-R222, K180-D301, Q291-D301, H252-Q302, H252-W192, and K180-D299 in mouse sRANKL (PDB ID: 1S55) during 100 ns MD simulation at the fix and free state. The distance change = distance in sRANKL or fixed-RANKL- the distance in crystal structure (PDB ID: 1S55). The number of distance change is aligned from small to large. Overall, most of them in both sRANKL and fixed-RANKL were getting larger. H252-Q302, H252-W192 in both sRANKL and mRANKL were maintained. In Y234- H224, Y234-D301 and Q236-R222, sRANKL exhibited larger changing than mRANKL in most of times. **b** The frequency of distance summation of Y234-H224, K180-H224, Y234-H224 and Y234-D303 of mouse sRANKL (PDB ID: 1S55) in free or fixed state during 100 ns MD simulation.

Supplementary Fig. 2. Activity, Cytotoxicity, Binding Affinity, Structure-Activity Relationship Analysis, and Pharmacokinetics Study.

a (1-4) IC_{50} curve and representative OC microphotographs of S3 modified active compounds. Left: IC_{50} curve of S3 modified compounds. Right: representative microphotographs of multinucleated TRAP-positive osteoclasts from each group. IC_{50} values were calculated by GraphPad Prism 8 software. **b** Summary of structure-activity relationship studies of S3 compound in osteoclast differentiation and apoptosis assays. A single aromatic ring is more suitable for R1 substitution. When isoquinoline (S3-17) and benzothiazole ring (S3-16) is applied, the activity is decreased compare to thiazole (S3, S3-08) or pyridine ring (S3-15). Moreover, the morpholine ring (S3-18) totally lost activity. Therefore, a single aromatic ring is more preferred. Increasing hydrophilicity of thiazole ring like removing Me group (S3-09) or introducing morpholine (S3-20) ring significantly decreased the activity, well the carboxylic acid group (S301) totally lost activity. Both hydrophilic group (S3-15-1) and hydrophobic group (S3-15-2) in pyridine ring affects the activity little. This data further indicated that the size of R1 substituent may be important for activity, hydrophobic or large substituent decrease the activity. For R2 substituent, a hydrogen bond donor such as OH (S3-05) or F (S3-14) at 4-position can maintain the activity. All the other groups decrease or lost activity. The carboxylic acid group at 2-position is essential for activity, changing the substituted position (S3-02 and S3-03) all affect the activity. Changing acid to OH (S3-06) or CH_2OH (S3-07) also suppress the inhibition effects. Larger substitution (S3-22 and S3-15-4) on the position of methyl group (green box) will decrease the activity. A small group seems to be preferred. **c** Pharmacokinetics of S3, s3-05, and S3-15. Male SD rats were dosed orally with S3, s3-05, and S3-15 at 10 mg/kg. Concentration in the plasma within 48 hr were detected by HPLC-MS. Compartmental pharmacokinetics parameters were assessed using WinNonlin Pharmacokinetics software. Data are presented as the mean \pm s.d. $n=3$ for each group. Statistical difference was determined by unpaired two-tailed Student's *t* test. Significant difference *p* value is < 0.05 .

a Binding affinity of compound S3-05 to sRANKL by ITC assay with KD value of 6.58 μM. **b** Osteoclastogenesis activity of L-RANKL and WT sRANKL. **c** Designed of biotin probe. The red box represents that introducing group may not affect activity. The blue box represents that introducing group will decrease activity significantly. According to the SAR study, one synthesis was success and afforded compound **S3-15B**. Considering introducing large group or hydrophilic group can decrease the activity (see also supplementary Fig. 2b), the biotin is introduced into thiazole ring of S3 which gave inactive probe **S3B**. **d** Anti-osteoclastogenesis activity of biotin and its conjugate compounds, **S3B** and **S3-15B**. a Representative TRAP staining images (left) of mouse BMMs cultured with different mutant sRANKL or WT sRANKL. Osteoclast numbers were counted (right). $n = 3$ per group. Scale bars, 50 μm . **b** In WT sRANKL-induced osteoclastogenesis system, the anti-osteoclastogenesis activity of **S3-15** is reduced when W194A sRANKL added (left, OC TRAP-stained pictures taken from one of three biological replicates. right, the OC numbers were counted in each well and presented in mean \pm s.d. Unpaired two-tailed Student's t test. $n = 3$ per group. **c** The MD simulation process of **S3-15** with fixed-RANKL. After 4 ns MD simulation, **S3-15** moved to upside and lost all H-bonds with fixed-RANKL. Then **S3-15** kept moving upside at 17ns and 52ns. At 52ns, **S3-15** already moved to the tips of fixed-RANKL, and formed two $p-\pi$ conjugation interactions with S229 and S231. At 54ns, **S3-15** totally lost binding with fixed-RANKL and away from it. **d-k** The binding model of **S3-05**, **S3-08**, **S3-01**, **S3-03**, **S3-00**, **S3-11**, **S3-02**, and **S3-04**. **l** Cross-link assay results that identifying whether **S3** and **S3-15** affect sRANKL trimerization. Both cannot affect sRANKL trimerization in different concentrations. **m** S3-15 influenced sRANKL binds to OPG at high concentration of 10 and 1 μM . However, it cannot affects sRANKL and OPG binding at lower concentration of 0.3 μM . **n** **S3-15** has no effects on human mRANKL expressed on MC3T3 cell lines and human OPG binding. **o** **S3-15** has no effects on mouse mRANKL expressed on MC3T3 cell lines and mouse OPG binding. **p** The results of pull-down assay that evaluating whether **S3-15** affects and mouse OPG binding. **S3-15** has no effects on mouse mRANKL expressed on 293T cell lines and mouse OPG binding. Error bars represent \pm s.d. $n=3$. Statistical difference was determined by one-way ANOVA followed by Tukey's multiple comparisons test. Significant difference p value is < 0.05 .

Supplementary Fig.5. In Vitro Activity Evaluation and Signal Pathway Study of compound S3-15.

a Western blot of PI3K and AKT phosphorylation in RAW264.7 cells treating with or without S315 and sRANKL at different point-in-time. **b** EC₅₀ curve and representative OC microphotographs of mature osteoclasts apoptosis assay with **S3-15**. n=3 biological replicates for each concentration. EC₅₀ values were calculated by GraphPad Prism 8 software. **c** EC₅₀ curve and representative OC microphotographs of mature osteoclasts apoptosis assay with **S3**, **S3-03** and **S3-05**. n=3 biological replicates for each concentration. EC₅₀ values were calculated by GraphPad Prism 8 software. **d** Bone resorption experimental results show that **S3** and **S3-05** suppresses RANKL-induced resorption pits in dose-dependent manner (mouse BMMs). **e** Precursor osteoblasts C3H10T12 proliferation-promoting of **S3**, **S3-05** and **S3-15**. **f** Osteoblastic mineralization after treatment with **S3**, **S3-05** and **S3-15**. C3H10T12 cells were cultured in osteoblast induction differentiation medium with or without treatment for 14 days and determinate of calcium deposition in differentiated osteoblasts by Alizarin red staining. Error bars represent ± s.d. n=3. Statistical difference was determined by unpaired two-tailed Student's t test. Significant difference *p* value is < 0.05. Scale bars for b-d, 50 μm.

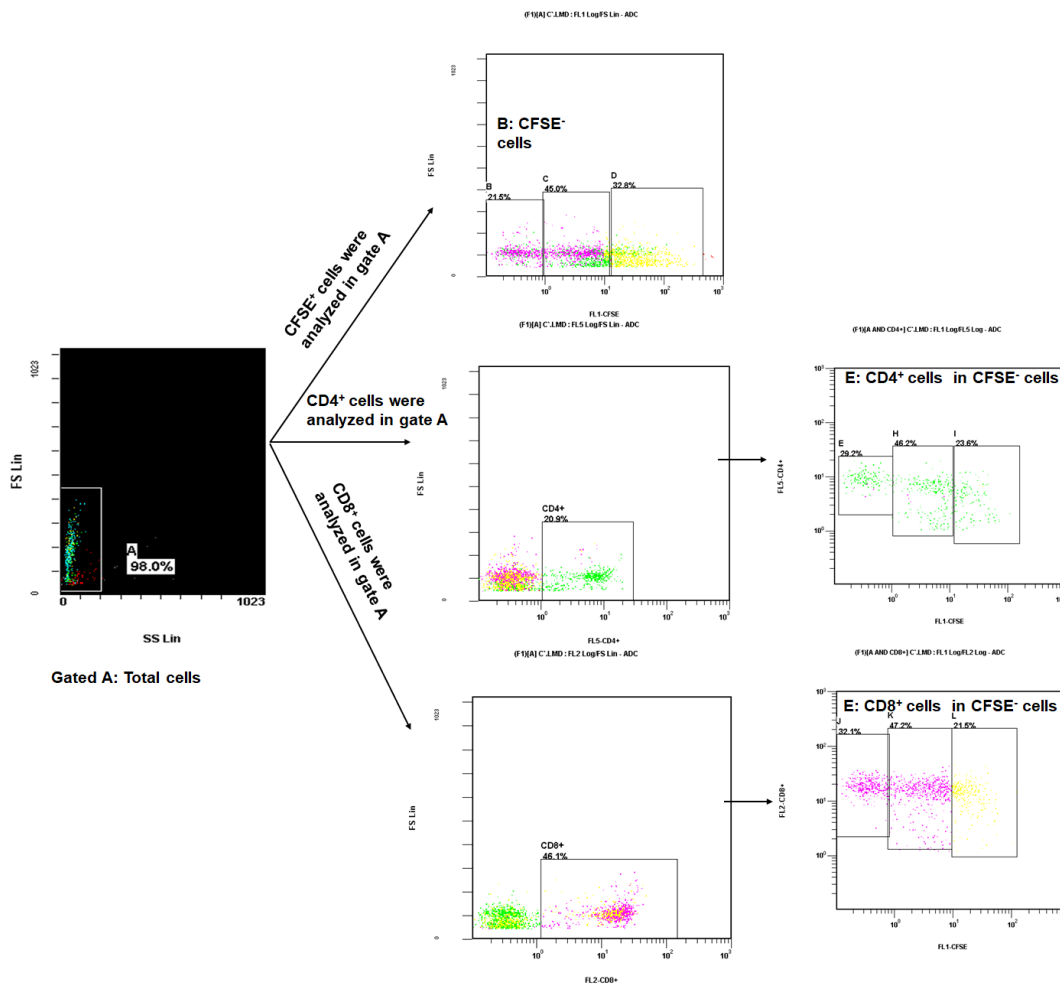

Supplementary Fig. 6. Lymphocyte proliferation and differentiation effects of S315 and denosumab.

a The effects of **S3-15** and denosumab on lymphocyte proliferation. Lymphocyte isolated from two healthy donors and one cancer patient donor were treated with **S3-15** or denosumab for 3 days, 9 days or 12 days. The ratio of CFSE-cells were detected by flow cytometry and calculated to evaluate lymphocyte proliferation. **b** The effects of **S3-15** and denosumab on T lymphocyte differentiation in total cells. After treating with **S3-15** or denosumab for 3 days, 9 days or 12 days, CD4+ T cell and CD8+ T cell were detected by flow cytometry and calculated the ratio in total cells. **c** The effects of **S3-15** and denosumab on T lymphocyte differentiation in CFSE- cells. Ratio of CD4+ T cell and CD8+ T cell in gate of CFSE- cells were analyzed after flow cytometry. Error bars represent \pm s.d. n=3 for healthy donors 2. n=4 for healthy donors 1 and cancer patient donor 1. Statistical difference was determined by unpaired two-tailed Student's t test. Significant difference p value is < 0.05.

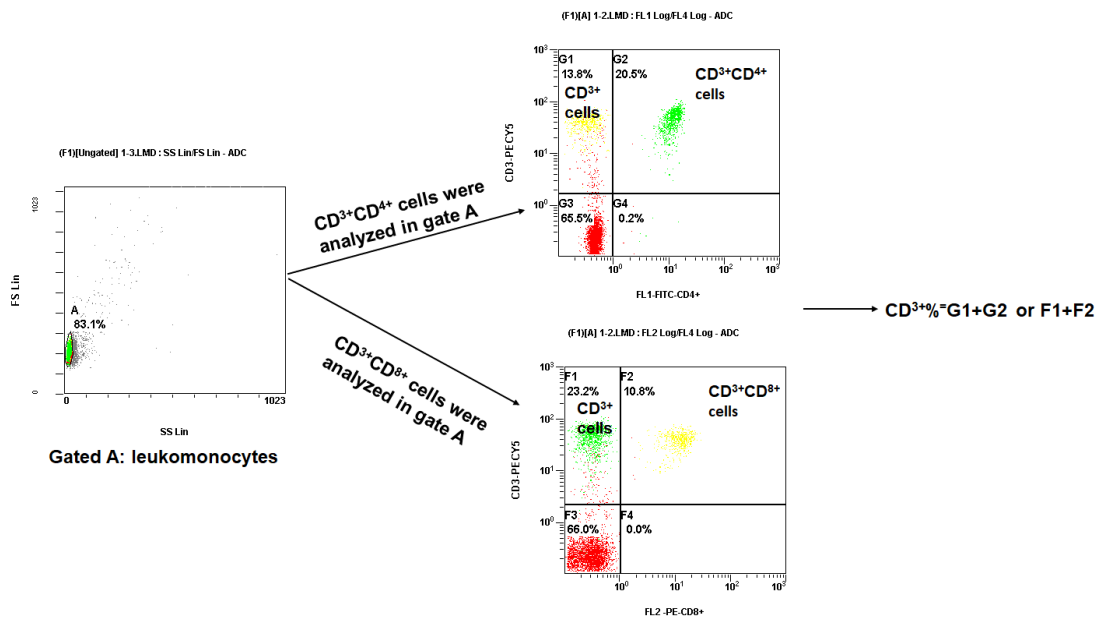

Supplementary Fig. 7. Analysis of S3, S305, and S315 Activity, Toxicity In Vivo.

a Compound **S3** and **S3-05** reduces bone loss in OVX rats. Representative μ CT images of the trabecular of ROI in distal femur of rat sham, OVX or treated with **S3** and **S3-05**. Scalar bar, 500 μ m. **b** Compound **S3** and **S3-05** improve trabecular osteoporosis parameters in OVX rats. The value of BV/TV, Tb.Th, Tb.N in OVX rats treating with 10mg/kg/d **S3** and **S3-05** were significantly increase, while the value of Tb.Sp were significantly decrease. **c** Serum bone resorption marker CTX-I, Glu- osteocalcin, and RANKL or bone formation marker osteocalcin and PINP levels measured by ELISA. **d** In vivo toxicity evaluation of compound **S3-15**. The weight of the rats was recorded every four weeks. At the end of the treatment, heart, liver, spleen, lung, kidney, uterus, thymus was weighted and calculate their organ coefficients to examine the effects of **S3-15** on rats. **e** Serum Ca, P, AST, ALT, ALP, CREA, BUN, Glu, TC, TG, TBIL, and TBA level were also determined. **f** Histological examination of tissue sections from the femur of mice using TRAP staining. The osteoclasts were stained in red (left). Trap positive area was calculated (right). The result indicated that **S3-15** significantly inhibits osteoclast differentiation compare to OVX. The number of rats in each group is as follows: sham n=9, OVX n=10, OVX+S3-05 n=8, OVX+S3 n=7, S3-15 n=9. The number of mice is n=8 in each group. Data are expressed as the mean \pm s.d. Statistical difference was determined by one-way ANOVA followed by Tukey's multiple comparisons test. Significant difference *p* value is < 0.05.

The sequences of sRANKL and mRANKL mimics

The amino acid sequence of sRANKL was the C-terminal extracellular region of RANKL (rat 159-318 aa). The amino acid sequence of mRANKL was two sRANKL monomers linked by -Gly-Ser-Gly-Ser-. (1) sRANKL (rat 159-318 aa)
