**Abbreviations:** MoCA, Montreal Cognitive Assessment; TMT, Trail Making Test; Digit Span, Wechsler Adult Intelligence Scale-IV Digit Span test; LDST, Letter Digit Substitution Test. CFQ, Cognitive Failure Questionnaire; HADS, Hospital Anxiety and Depression Scale; SF-12, Short Form Health Survey-12; BSI, Brief Symptom Inventory; GSI, Global Severity Index. All individual test results were corrected for age, education, and sex using normative data of normal Dutch control population.

**Weighted test results:** *unimpaired*: T-score >40 (> -1 SD); *below average*: T-score 35-40 (-1.5 to -1 SD); *impaired*: T-score <40 (< -1.5 SD). **Dichotomization:** Patients were categorized as *objectively* cognitively impaired if they had a weighted score of *impaired* at two or more tests. Patients were categorized as *subjectively* cognitively impaired when CFQ scores were 44 or higher.
