Table of Contents

Supplementary Fig 1. Maternal ultra-processed food consumption from 1991 to 2015.

Supplementary Fig 2. Association between maternal consumption of individual types of ultra-processed foods during peri-pregnancy and the risk of overweight or obesity in offspring.

Supplementary Fig 3. Association between maternal consumption of ultra-processed foods during peripregnancy and the risk of overweight or obesity in offspring by risk factors.

Supplementary Table 1. Maternal (NHS2) and offspring (GUTS2) characteristics according to maternal consumption of ultra-processed foods during peri-pregnancy.

Supplementary Table 2. Association between maternal consumption of ultra-processed foods during the child-rearing period and offspring body weight measures.

Supplementary Table 3. Relative risk (95% confidence interval) of overweight in offspring according to maternal consumption of ultra-processed foods during the child-rearing period, with multiple imputation for missing offspring body mass index.

Supplementary Table 4. Relative risk (95% confidence interval) of overweight or obesity in offspring according to maternal consumption of ultra-processed foods during the child-rearing period, after excluding participants with missing covariates (N=15,025).

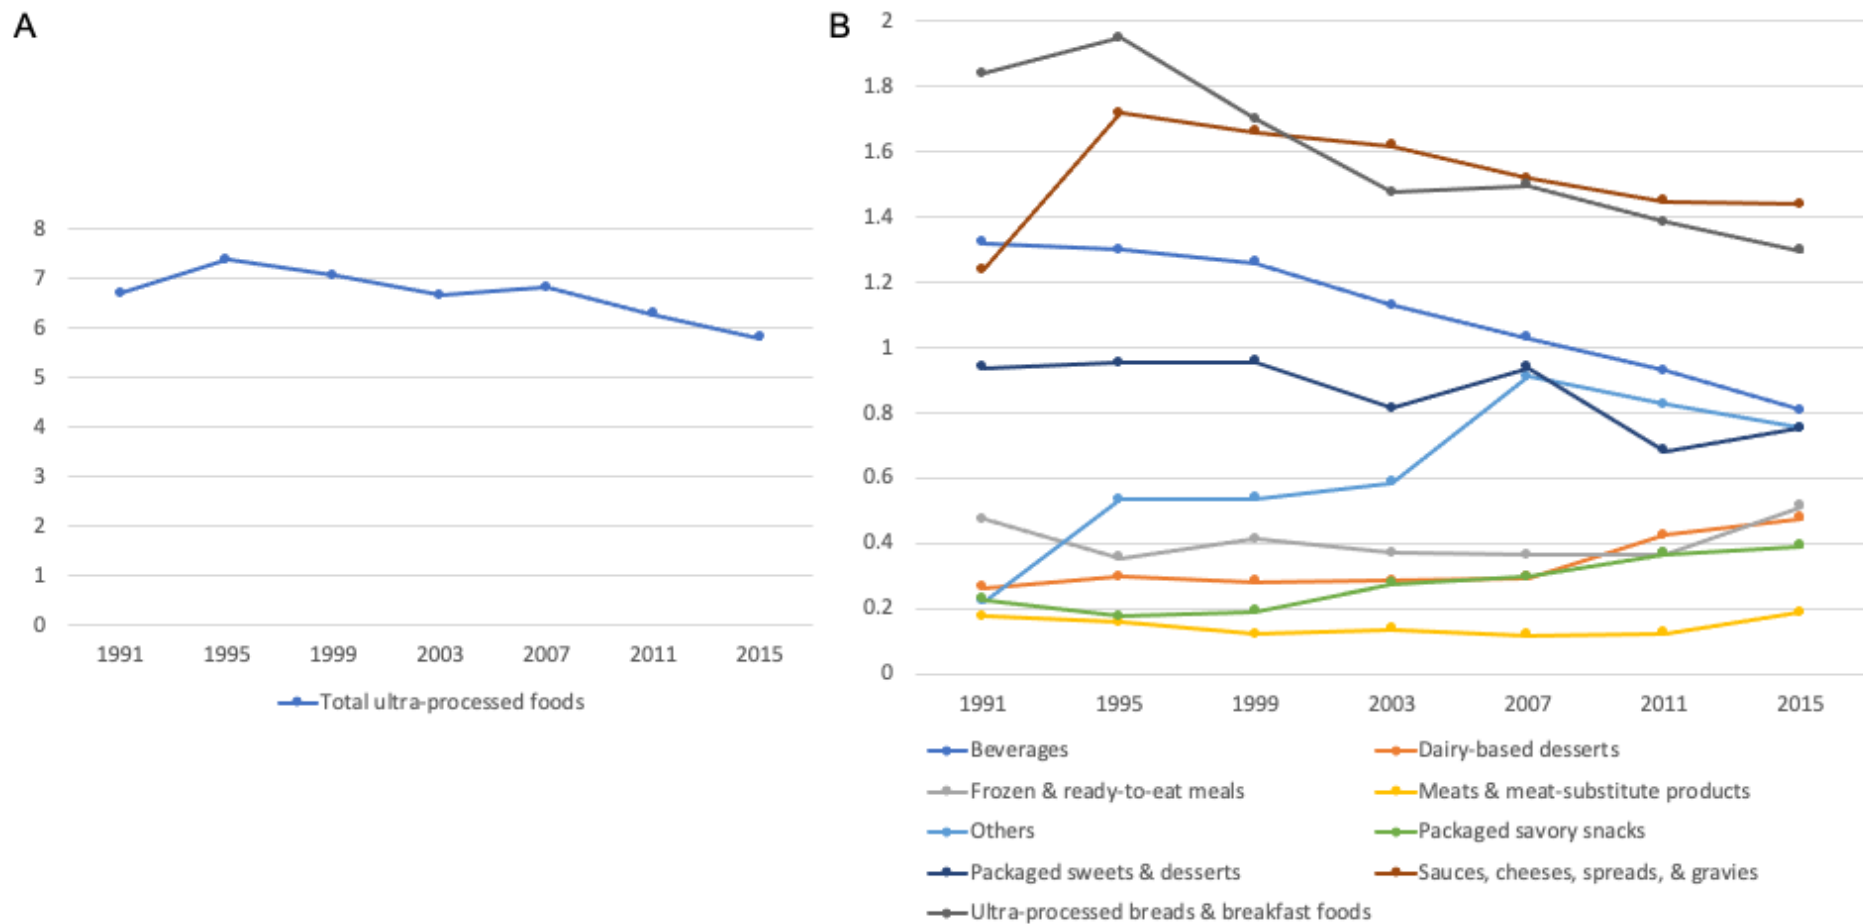

Supplementary Table 5. Relative risk (95% confidence interval) of overweight or obesity in offspring according to maternal consumption of ultra-processed foods during peri-pregnancy.

Supplementary Table 6. Association between maternal ultra-processed food consumption during peri-pregnancy and other offspring's measures of weight status.

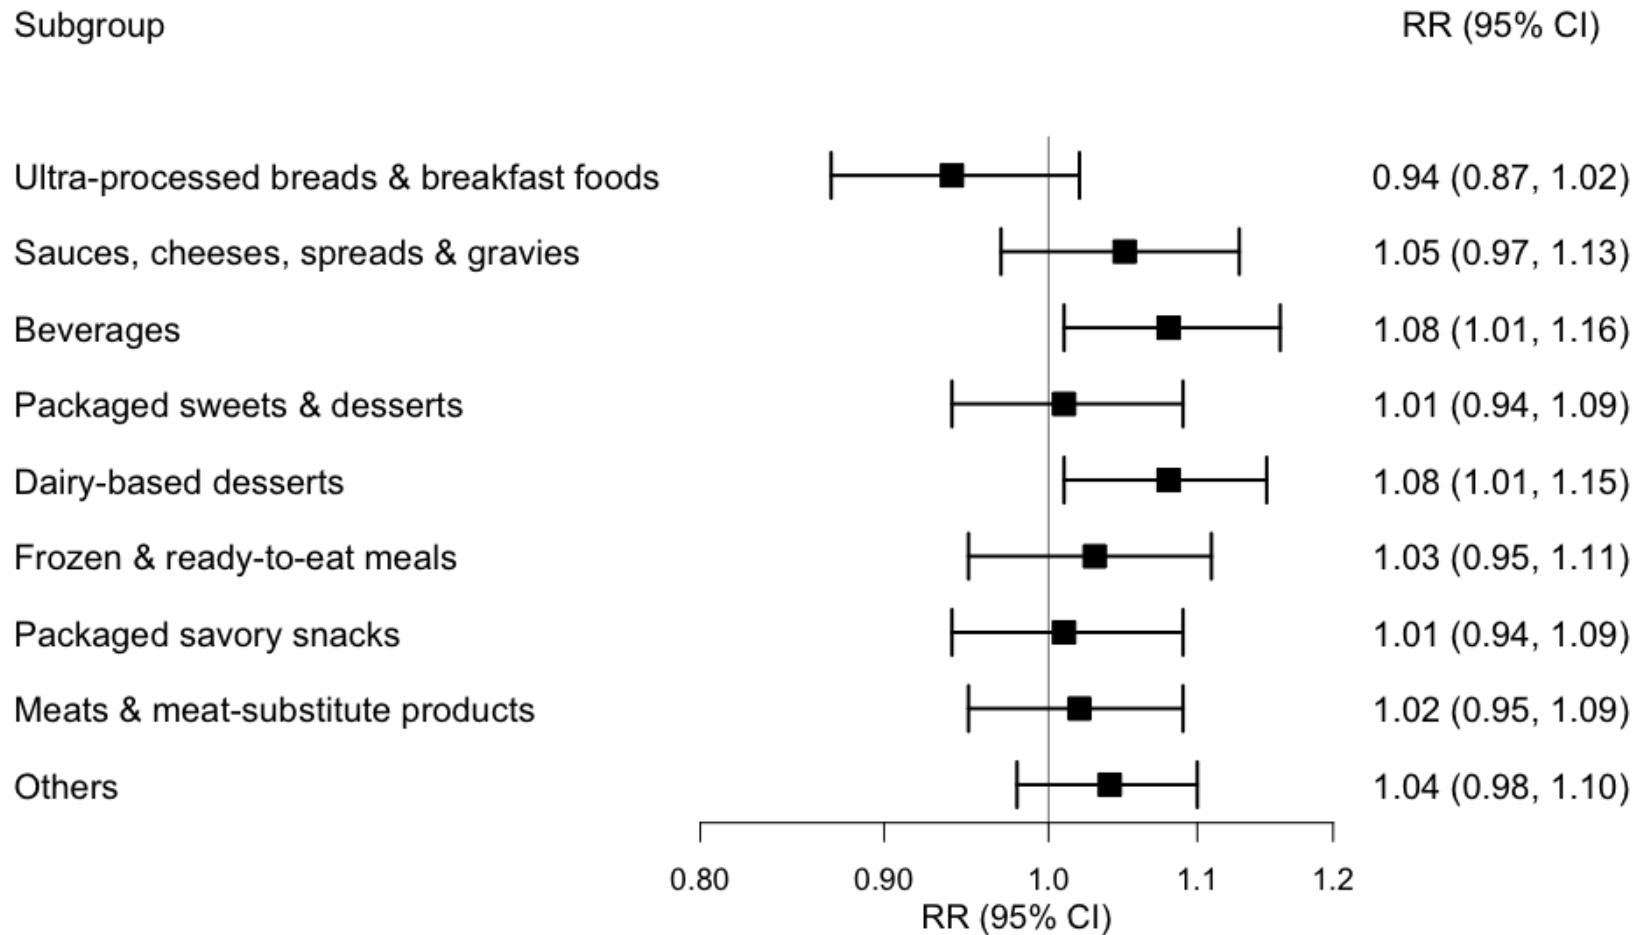

Supplementary Table 7. Sensitivity analysis for the relative risk (95% confidence interval) of overweight in offspring with multiple imputation of missing body mass index according to maternal consumption of ultra-processed foods during peri-pregnancy.

Supplementary Table 8. Relative risk (95% confidence interval) of overweight in offspring according to change in maternal consumption of ultra-processed foods from peri-pregnancy to child-rearing period.

Supplementary Table 9. Relative risk (95% confidence interval) of overweight in offspring according to per 1 standard deviation increase in maternal consumption of ultra-processed foods during peri-pregnancy and child-rearing period (mutually adjusted).

Supplementary Fig 1. Maternal ultra-processed food consumption from 1991 to 2015. Trends in mean consumption (servings/day) of **(A)** total ultra-processed foods and **(B)** subgroups of ultra-processed foods among 14,553 mothers. Linear trend was tested by modeling the 7 questionnaire cycles as an ordinal independent variable. All P -trend ≤ 0.05 .

Supplementary Fig 2. Association between maternal consumption of individual types of ultra-processed foods during peri-pregnancy and the risk of overweight or obesity in offspring. Relative risks (RR) and 95% confidence intervals (CI) were estimated for each 1 standard deviation increase in ultra-processed food intake. Generalized estimating equation was adjusted for maternal age at pregnancy, race, maternal total energy intake, maternal risk factors before pregnancy (BMI, physical activity, smoking, parity), household income, spouse's education, and offspring's risk factors (sex, gestational age, consumption of ultra-processed foods). Individual types of ultra-processed foods were mutually adjusted.

Supplementary Fig 3. Association between maternal consumption of ultra-processed foods during peri-pregnancy and the risk of overweight or obesity in offspring by risk factors. Relative risks (RR) and 95% confidence intervals (CI) for the highest quintile of ultra-processed food intake compared to the lowest quintile was estimated using generalized estimating equation adjusted for maternal age at pregnancy, race, total energy intake, pre-pregnancy BMI, offspring sex, and offspring consumption of ultra-processed food, physical activity. P-heterogeneity was calculated using Cochran's Q test.

Supplementary Table 1. Maternal (NHS2) and offspring (GUTS2) characteristics according to maternal consumption of ultra-processed foods during peri-pregnancy.

	Quintiles of maternal ultra-processed food consumption during peri-pregnancy				
	Q1	Q2	Q3	Q4	Q5
Maternal characteristics

^aModel adjusted for maternal risk factors (age at delivery, race, total energy intake) and offspring sex. Relative risks of obesity and larger than normal somatotype at age 5 were assessed using generalized estimating equation and mean differences in BMI percentile and birth weight were assessed using linear mixed regression.

^bAdjusted for Model 1 covariates and other maternal risk factors before pregnancy (BMI, physical activity, smoking, parity), household income, spouse's education, and gestational age.

^cAdjusted for Model 2 covariates and offspring's consumption of ultra-processed foods.

^dAdjusted for Model 3 covariates and maternal 2010 Alternative Healthy Eating Index score, offspring's birth weight, physical activity, and sedentary time.

^eAdjusted for Model 2 covariates and maternal 2010 Alternative Healthy Eating Index score and offspring's birth weight (not for the analysis of birth weight).

^fLinear trend was tested using standardized maternal ultra-processed food consumption as a continuous variable.

Supplementary Table 7. Sensitivity analysis for the relative risk (95% confidence interval) of OWOB in offspring with multiple imputation of missing body mass index according to maternal consumption of ultra-processed foods during peri-pregnancy.

	Q1	Q2	Q3	Q4	Q5	P-trend ^e
N (%)	204 (34.8)	196 (33.6)	202 (34.4)	204 (34.8)	212 (36.2)	NA
Model 1 ^a	1 (reference)	1.00 (0.83, 1.19)	1.12 (0.93, 1.35)	1.13 (0.92, 1.38)	1.23 (1.00, 1.51)	0.05
Model 2 ^b	1 (reference)	0.94 (0.75, 1.19)	1.05 (0.82, 1.35)	1.06 (0.81, 1.39)	1.13 (0.85, 1.51)	0.22
Model 3 ^c	1 (reference)	0.95 (0.75, 1.20)	1.06 (0.83, 1.36)	1.07 (0.82, 1.40)	1.14 (0.85, 1.52)	0.23
Model 4 ^d	1 (reference)	0.96 (0.76, 1.22)	1.07 (0.83, 1.38)	1.08 (0.82, 1.42)	1.12 (0.83, 1.51)	0.26

^aGeneralized estimating equation adjusted for maternal risk factors (age at pregnancy, race, 2010 Alternative Healthy Eating Index score, total energy intake) and offspring sex.

^bAdjusted for Model 1 covariates and other maternal risk factors before pregnancy (BMI, physical activity, smoking, parity), household income, spouse's education, offspring's birth weight, and gestational age.

^cAdjusted for Model 2 covariates and offspring's consumption of ultra-processed foods during follow-ups.

^dAdjusted for Model 3 covariates and maternal 2010 Alternative Healthy Eating Index score, offspring's birth weight, physical activity, and sedentary time.

^eLinear trend was tested using standardized maternal ultra-processed food consumption as a continuous variable.

Supplementary Table 8. Relative risk (95% confidence interval) of OWOB in offspring according to change in maternal consumption of ultra-processed foods from peri-pregnancy to child-rearing period^e

	Maintained low	From low to high	From high to low	Maintained high	Per serving/d increase	P-value ^e
N (%)	74 (9.6)	46 (12.0)	37 (9.3)	90 (11.6)	NA	NA
Model 1 ^a	1 (reference)	1.26 (0.89, 1.79)	1.05 (0.70, 1.56)	1.35 (0.98, 1.86)	1.03 (0.99, 1.07)	0.18
Model 2 ^b	1 (reference)	1.19 (0.84, 1.70)	1.02 (0.68, 1.52)	1.27 (0.91, 1.76)	1.03 (0.99, 1.07)	0.18
Model 3 ^c	1 (reference)	1.22 (0.84, 1.78)	1.04 (0.68, 1.60)	1.33 (0.92, 1.91)	1.03 (0.99, 1.07)	0.21
Model 4 ^d	1 (reference)	1.24 (0.85, 1.81)	1.05 (0.68, 1.61)	1.35 (0.94, 1.96)	1.03 (0.99, 1.07)	0.21

^aParticipants were categorized by the medians of maternal consumption of ultra-processed during peri-pregnancy (6.34 servings/day) and follow-up (6.29 servings/day). Low consumption denotes below the median, and high consumption denotes at or above the median.

^bGeneralized estimating equation adjusted for maternal risk factors (age at delivery, race, total energy intake) and offspring sex.

^cAdditionally adjusted for maternal risk factors before pregnancy (BMI, physical activity, smoking, parity), household income, spouse's education, and gestational age.

^dAdditionally adjusted for offspring consumption of ultra-processed foods.

^eAdditionally adjusted for 2010 Alternative Healthy Eating Index score, offspring's birth weight, physical activity, and sedentary time.

^fLinear trend was tested using standardized maternal ultra-processed food consumption as a continuous variable.

Supplementary Table 9. Relative risk (95% confidence interval) of OWOB in offspring according to per 1 standard deviation increase in maternal consumption of ultra-processed foods during peri-pregnancy and child-rearing period (mutually adjusted)^e

	During peri-pregnancy	P-value	During child-rearing period	P-value
Model 1 ^a	1.06 (0.91, 1.23)	0.45	1.16 (1.03, 1.30)	0.02
Model 2 ^b	1.04 (0.90, 1.21)	0.61	1.14 (1.01, 1.28)	0.03
Model 3 ^c	1.04 (0.88, 1.24)	0.65	1.15 (1.01, 1.31)	0.04
Model 4 ^d	1.05 (0.88, 1.25)	0.58	1.15 (1.01, 1.32)	0.03

^aParticipants were categorized by the medians of maternal consumption of ultra-processed during peri-pregnancy (6.34 servings/day) and follow-up (6.29 servings/day). Low consumption denotes below the median, and high consumption denotes at or above the median.

^bGeneralized estimating equation adjusted for maternal risk factors (age at delivery, race, total energy intake) and offspring sex.

^cAdditionally adjusted for maternal risk factors before pregnancy (BMI, physical activity, smoking, parity), household income, spouse's education, and gestational age.

^dAdditionally adjusted for offspring consumption of ultra-processed foods.

^eAdditionally adjusted for 2010 Alternative Healthy Eating Index score, offspring's birth weight, physical activity, and sedentary time.
