<b>Figure S4</b> Distribution of DFT-calculated results for (a) $a$ (FCC), (b) $a$ (BCC), (c) $\Delta H_f$ (FCC), and (d) $\Delta H_f$ (BCC) for individual compositions.....	7
<b>Figure S5</b> Distribution of ML-predicted results for (a) $a$ (FCC), (b) $a$ (BCC), (c) $\Delta H_f$ (FCC), and (d) $\Delta H_f$ (BCC) for individual compositions.....	8

## 1. Validation of KKR-CPA method for multi-component alloys

Troparevsky *et al.* [1] demonstrated that the KKR-CPA method provided accurate results for multi-component alloys. The fcc CrFeCoNi supercell with 2,048 atoms was calculated by the locally self-consistent multiple scattering (LSMS) method. The calculated magnetic moments of the KKR-CPA are closed to that of the LSMS method. Hu *et al.* experimentally prepared NbMoTaWV high-entropy alloy (HEA) using vacuum arc melting, which obtained BCC structure from the X-ray diffraction result [2]. The formation energy and lattice parameters were calculated using the density functional theory to validate the HEA containing five elements. The authors [2] designed the HEA model using a special quasi-random supercell (SQS) method. Our calculation is based on the KKR-CPA method through the Akai-KKR (Machikaneyama) package [3, 4], where the computational details are revealed in section 2 of this paper. As shown in **Table S1**, the KKR-CPA method provided the calculation results close to the experimental data [2]. In addition, the enthalpy of formation energy ( $\Delta H_f$ ) via KKR-CPA is the same trend that results via the SQS method. The BCC structure showed the lowest  $\Delta H_f$  which is the thermodynamically stable phase of the NbMoTaWV HEA. Other single-phase alloys found in literature data were used to validate the accuracy of KKR-CPA implemented in the Akai-KKR package, as shown in **Table S2**. As a result, the KKR-CPA can indicate the FCC and BCC phase stability of multi-component alloys.

**Table S1** Enthalpy of formation energy ( $\Delta H_f$ ) in eV/atom and lattice parameters in Å of

NbMoTaWV calculated by DFT+SQS and KKR–CPA method.

NbMoTaWV	Formation energy	Lattice parameters
BCC	-0.092 (DFT+SQS)* 0.423 (KKR-CPA)**	a = 3.185 (experiment)* a = 3.167 (DFT+SQS)* a = 3.203 (KKR-CPA)**
FCC	0.406 (DFT+SQS)* 1.107 (KKR-CPA)**	- a = 4.089 (KKR-CPA)**
HCP	0.563 (DFT+SQS)* 2.647 (KKR-CPA)**	- a = 2.780, c/a = 1.1 (KKR-CPA)**
Experimental data (BCC)	-	a = 3.185*
