

SUPPLEMENTARY FIG. S10. IL6 or TNF α treatment did not decrease SIRT1 protein levels in hepatocytes. (A) Hepatocytes were treated with recombinant IL1 β (20 ng/ml), IL6 (20 ng/ml), or TNF α (50 ng/ml) for 16 h, and then, SIRT1 protein levels were analyzed by WB. After quantification of all blots, results are expressed as fold change relative to untreated hepatocytes and are mean \pm SEM. Statistical analysis was performed by one-way ANOVA followed by Newman–Keuls multiple comparison test. *** $p < 0.001$ versus untreated hepatocytes. TNF α , tumor necrosis factor alpha.
