Preface

1. **Additional file 1 Fig. S Pre. 1** Blueprint for this study.

Section A. Data selection and quality control

2. **Additional file 1 Table S A1** Recombination events of DENV-1 scanned by seven models.
3. **Additional file 1 Table S A2** Summary of 5003 DENV-1 strains eligible for inclusion in this study.

Section B. Establishment of a unified high-resolution global genotyping framework of DENV-1

4. **Additional file 1 Fig. S B1** The viral population numbers and intra-population diversity of DENV-1 inferred using BAPS hierarchical clustering.
5. **Additional file 1 Fig. S B2** Characteristics of MPDs of BAPS raw clusters.
6. **Additional file 1 Fig. S B3** Demography of DENV-1 subgenotypes and clades.
7. **Additional file 1 Table S B1** Summary of characteristics of the designated subgenotypes in genotypes I, IV, and V of DENV-1.
8. **Additional file 1 Table S B2** Summary of characteristics of the designated clades in genotypes I, IV, and V of DENV-1.

Section C. Ancestral state reconstruction and molecular clock phylogenetic analyses

9. **Additional file 1 Table S C1** Characteristics of each designated subgenotype in genotypes I, IV, and V of DENV-1 worldwide.
10. **Additional file 1 Table S C2** Characteristics of each designated clade in genotypes I, IV, and V of DENV-1 worldwide.

Section D. Characterization of the unified global genotyping framework of DENV-1

11. **Additional file 1 Fig. S D1** Trends of global increasing expansion of DENV-1.
12. **Additional file 1 Table S D1** The associations between the substitution rates and tMRCA of the included clades evaluated by the linear regression model after adjustment of the strains number, MPDs and Simpson Index.

Section E. Global geographic distribution and epidemic regional classification

13. **Additional file 1 Fig. S E1** Global geographical distributions of genotypes I, IV, and V of DENV-1 by countries/areas.
14. **Additional file 1 Fig. S E2** Global spreading of DENV-1 genotypes I, IV, and V clades by countries/areas from 1944 to 2017 counted by every ten years.

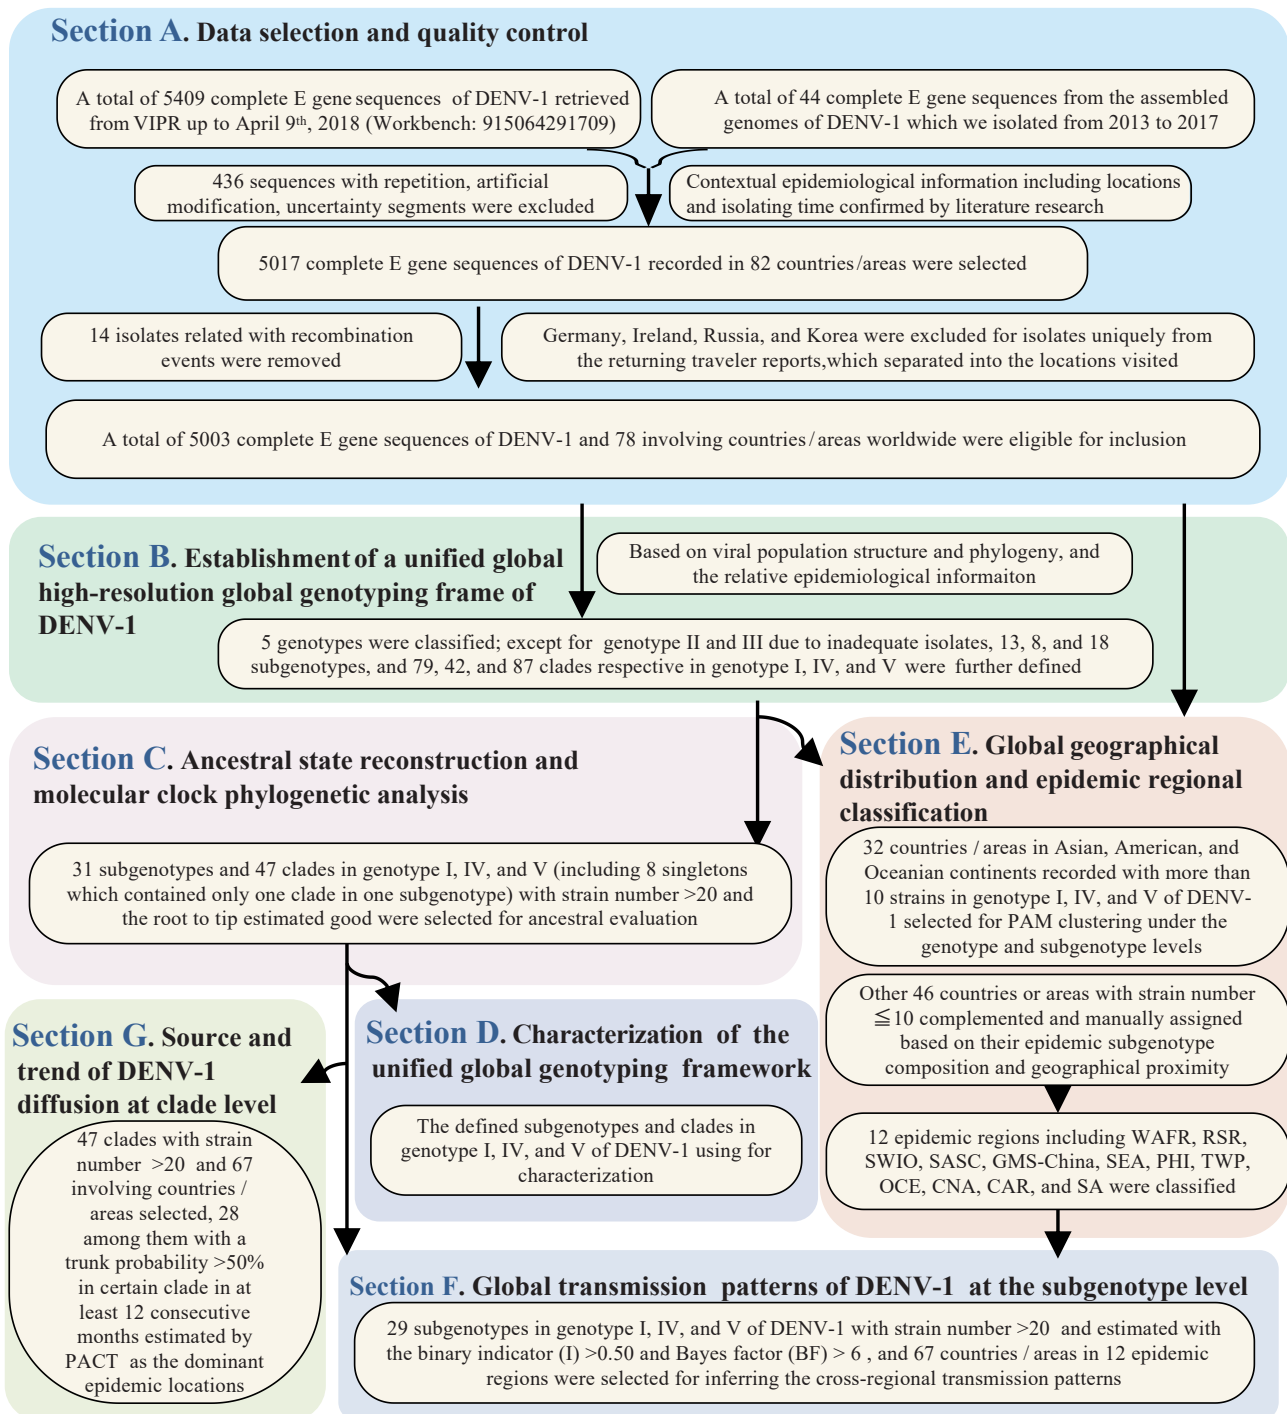

15. **Additional file 1 Fig. S E3** Geographical hierarchical clustering of DENV-1 at the genotype and subgenotype levels.
16. **Additional file 1 Fig. S E4** Heatmap of defined clade distribution displayed by 12 epidemic regions by percentages.
17. **Additional file 1 Fig. S E5** Global geographical distributions of genotypes I, IV, and V of DENV-1 represent by 12 classified epidemic regions.
18. **Additional file 1 Fig. S E6** Heatmap of the defined clade distribution displayed by countries/areas by percentage.
19. **Additional file 1 Fig. S E7** Relatively specific circulation patterns of subgenotypes and clades kept relative steady in each epidemic region.
20. **Additional file 1 Table S E1** Compositions of countries/areas in the defined 12 epidemic regions of DENV-1.

Section F. Global transmission pattern of DENV-1 at subgenotype level

21. **Additional file 1 Fig. S F1** Estimates of 29 DENV-1 subgenotypes involving the transmission pairs inferred by BSSVS.
22. **Additional file 1 Fig. S F2** DENV-1 transmission pairs in each epidemic country/area within and without its belonging epidemic regions inferred by BSSVS at the subgenotype level.
23. **Additional file 1 Table S F1** The transmission pairs with involved subgenotypes $\cong 3$.
24. **Additional file 1 Table S F2** The transmission pairs inferred by BSSVS from 29 DENV-1 subgenotypes .

Section G. Sources and trend of DENV-1 diffusion at clade level

25. **Additional file 1 Fig. S G1** Dynamic changes of trunks representing the proportion of PACT-inferred dominant epidemic countries/areas for each DENV-1 clade circulation.
26. **Additional file 1 Fig. S G2** Temporal dynamics of clades in 28 PACT-inferred dominant countries/areas.
27. **Additional file 1 Table S G1** The status of 28 PACT-inferred dominant epidemic countries/areas and the clades of DENV-1 involved.

^a 5003 DENV-1 isolates including Genotype I: 2952; II:4; III: 2; V:560, and V: 1485 were identified in this study, see details in Fig. 1 and Additional file 1 Section B-D. WAFR, West African Region; RSR, Red Sea Region; SWIO, Southwest Indian Ocean; SASC, South Asia Subcontinent; GMS-China, Great Mekong Subregion-China; SEA, Southeast Asia; PHI, Philippines; TWP, Tropical Western Pacific; OCE, Oceania; CNA, Central North America; CAR, Caribbean; SA, South America. These 12 epidemic regions of DENV-1 were classified in this study, see details in Fig. 2 and Additional file 1 Section E.

B. Establishment of a unified high-resolution global genotyping framework of DENV-1

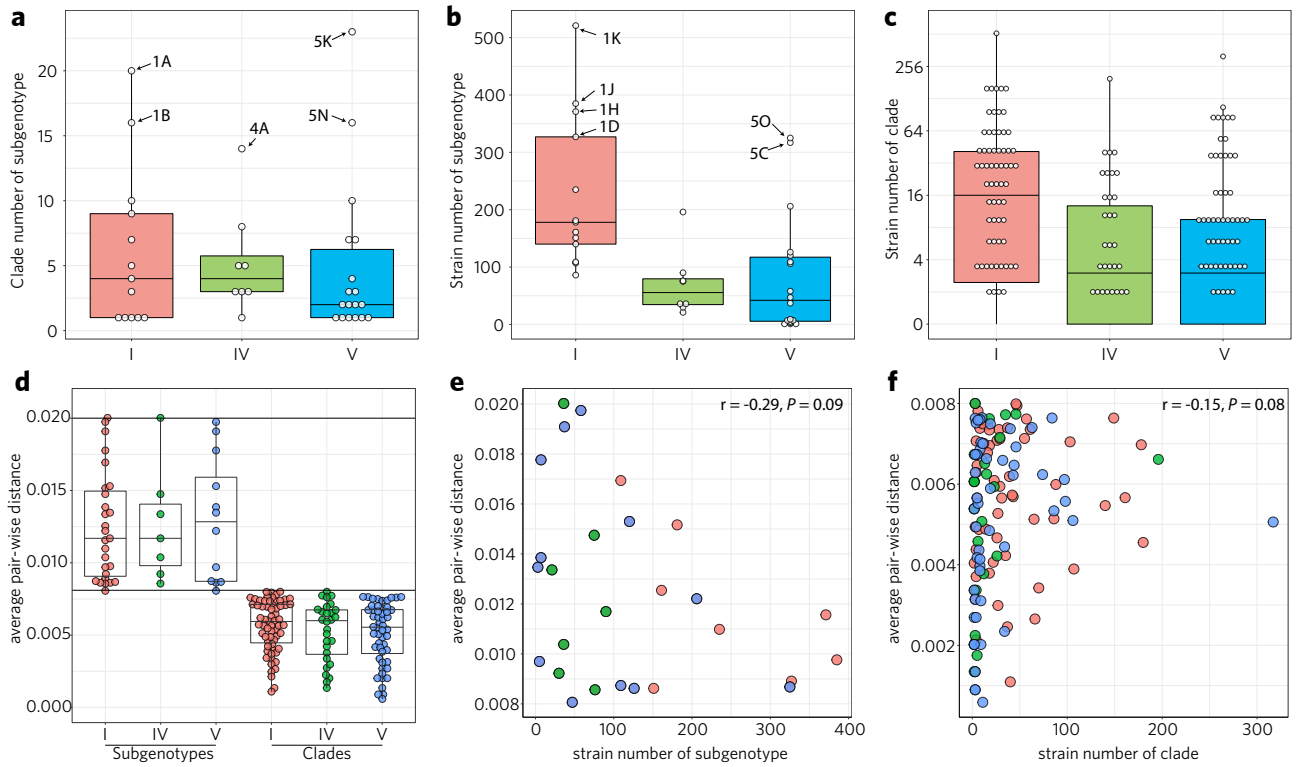

Our designation of subgenotypes and clades were well supported by BAPS clustered populations and phylogenetic robust bootstrap. Among them, the UFBoot support values of 32 (82%,32/39) designated genotypes and 162 (77.9%, 162/208) clades of DENV-1 genotypes I, IV, and V were higher than 70%, and 30 subgenotypes and 134 clades more than 90% (Table S B1-B2). While the subgenotypes and clades with the UFBoot values lower than 70%, some of them were singletons which containing only one clade or strain-including 4 subgenotypes 1E,1F, 5F and 5I, and 12 clades 1A17, 1M5, 1M6, 4A4, 4A6, 4A7, 4E3, 5F1, 5K18, 5N5, 5N6, and 5P10; some were mainly or uniquely from single country/area such as 1A15 from Somalia, 1D4 and 1E1 from Vietnam, 1G7,1G9, and 1G10 from Myanmar, 1H1 and 1J3 from Thailand, 1M1,1M2,1M9 and 4E8 from Indonesia, 4C2 from Philippines, 5N3 from Venezuela, 5N7 from Brazil, 5N11 from Honduras, 5O3 and 5O4 from Mexico, and 5Q2 from Puerto Rico, and so on (Table S B1-B2). Otherwise, the singletons in subgenotypes (12/41) (Table S C1) and clades (63/208) (Table S C2) in genotype I, IV, and V may suggest that these are DENV-1 population in minority, while otherwise might be partly caused by widely deficient surveillance.

Additional file 1 Fig. S B1 The viral population numbers and intra-population diversity of DENV-1 inferred using BAPS clustering. Three panels represent genotype I (Left), IV (Middle) and V (Right) of DENV-1, respectively. Lines with grey, blue, red, and green colour represent initial cluster number, logML, SWI, and SI, respectively. logML: log maximum likelihood, SWI: Shannon-Wiener index, SI: Simpson index.

Additional file 1 Fig. S B2 Characteristics of MPDs of BAPS raw clusters. a, MPDs distributions of raw clusters in BAPS hierarchical clustering levels 1-4 for DENV-1 and its genotypes I, IV, and V clustering. **b**, Cumulative distribution plot of MPDs of raw clusters in BAPS levels 1 and 4. MPDs of the majority (90%) of BAPS clusters generated from depth level 1 were below 0.02, and from depth level 4 below 0.008. **c**, Density distributions of MPDs of raw clusters in BAPS levels 1-4 for DENV-1 as well as its genotypes I, IV, and V.

Additional file 1 Fig. S B3 Demography of DENV-1 subgenotypes and clades. **a,b**, Demography of DENV-1 subgenotypes. There were 6.08 ± 4.86 , 5.25 ± 2.88 , and 4.83 ± 4.31 clades in genotype I, IV, and V, respectively. Five of the subgenotypes represent more abundant clades, 5K with 23, 1A with 20, 1B and 5N with 16, and 4A with 13. There were 227.08 ± 133.11 , 70.00 ± 56.88 , and 82.50 ± 104.77 strains in each subgenotype in genotype I, IV, and V, respectively. More abundant strains were found in subgenotypes 1E1 (348) and 5C1 (317). **c**, Demography of DENV-1 clades. There were 37.37 ± 38.53 , 13.33 ± 15.22 , and 17.07 ± 21.76 strains in each clade in genotype I, IV, and V, respectively. **d**, Distribution of the mean pairwise distance (MPDs) within subgenotypes and clades in genotypes I, IV, and V of DENV-1. MPDs within genotypes I, IV, and V were 2.3×10^{-2} , 4.3×10^{-2} , and 3.6×10^{-2} , respectively. **Left panel**: Subgenotypes. MPDs of all 39 subgenotypes were below 1.17×10^{-2} . MPDs of subgenotypes in genotype I, IV, and V were 1.13×10^{-2} , 1.17×10^{-2} , and 1.28×10^{-2} , respectively. Among them, nine subgenotypes with single clade were resulted in lower MPDs than 0.8×10^{-2} , which were not showed in the boxplots. **Right panel**: Clades. MPDs of all 208 clades were below 0.8×10^{-2} . MPDs of clades in genotype I, IV, and V are 0.57×10^{-2} , 0.49×10^{-2} , and 0.51×10^{-2} , respectively. The values of MPDs in details showed in **Table S B1-B2, C1-C2**. **e-f**, No significant correlation between the designated subgenotypes, clades and their values of MPDs, which were assessed using Spearman's rank correlation coefficient method.

Additional file 1 Table S B1 Summary of characteristics of the designated subgenotypes in genotype I, IV, and V of DENV-1

Genotype	I	IV	V	Total
Subgenotype rank structure				
means of clades in subgenotypes	6.08 ± 4.86	5.25 ± 2.88	4.83 ± 4.31	5.33 ± 4.26
means of strains in subgenotypes	227.08 ± 133.11	70.00 ± 56.88	82.50 ± 104.77	128.13 ± 97.45
BAPS clustering support ^a				
depth 1	13/13 (100%)	8/8 (100%)	9/18 (50%)	30/39 (76.9%)
depth 2	0	0	5/18 (27.8%)	5/39 (15.4%)
depth 3	0	0	2/18 (11.1%)	2/39 (10.3%)
UFBoot values support				
>90	9/13(69.2%)	8/8(100%)	13/18(72.2%)	30/39(76.9%)
70-90	0	0	2/18(11.1%)	2/39(5.1%)
<70	4/13(30.8%)	0	3/18(16.7%)	7/39(17.9%)
Means of MPDs ^b	1.13 [0.86, 1.69]	1.17 [0.86, 2.00]	1.28 [0.81, 1.97]	1.17 [0.81, 2.00]
Geographical diversity				
SWI	0.92 ± 0.51	0.99 ± 0.40	0.97 ± 0.55	0.96 ± 0.49
SI	0.43 ± 0.23	0.47 ± 0.18	0.48 ± 0.21	0.46 ± 0.22

^a If the DENV-1 strain in a designated subgenotype was exactly consistent with the BAPS cluster at a certain depth, the subgenotype was counted into the BAPS cluster support at that depth. If a subgenotype can be identified at more than one depth in the BAPS cluster, it was then included in the shallowest depth.

^b Thirteen singletons out of 39 subgenotypes with only one clade were not counted.

MPDs: Mean pairwise distances; SWI: Shannon-Wiener index; SI: Simpson index; UFBoot value: Ultrafast Bootstrap value

Additional file 1 Table S B2 Summary of characteristics of the designated clades in genotype I, IV, and V of DENV-1

Genotype	I	IV	V	Total
Clade rank structure				
means of strains of clades in subgenotypes	37.37 ± 38.53	13.33 ± 15.22	17.07 ± 21.76	24.02 ± 28.36
BAPS clustering support ^a				
depth 1	6/77 (7.8%)	1/42 (2.4%)	1/87 (1.5%)	8/208 (3.8%)
depth 2	14/77 (18.2%)	11/42 (26.2%)	16/87 (18.4%)	41/208 (19.7%)
depth 3	17/77 (22.1%)	9/42 (21.4%)	21/87 (24.1%)	47/208 (22.6%)
depth 4	25/77 (32.5%)	7/42 (16.7%)	18/87 (20.7%)	50/208 (24.0%)
UFBoot values support				
>90	25/79 (31.7%)	32/42 (76.2%)	55/87 (63.2%)	112/208 (53.8%)
70-90	14/79 (17.7%)	1/42 (2.4%)	14/87 (16.1%)	29/208 (13.9%)
<70	19/79 (%)	9/42 (21.4%)	18/87 (20.7%)	46/208 (22.1%)
Means of MPDs ^b	0.59 [0.11, 0.80]	0.57 [0.13, 0.80]	0.55 [0.06, 0.76]	0.57 [0.06, 0.80]
Geographical diversity

Note: Year_{first}: the year when the first strain of the subgenotype was recorded; Year_{latest}: the year when the latest strain of the subgenotype was recorded; PS_{observed}: Year_{latest} - Year_{first}; MPD: Mean pairwise distance; SWI: Shannon-Wiener index; SI: Simpson index; UFBoot: Ultrafast Bootstrap value; tMRCA: the most recent common ancestor.

D. Characterization of the unified global genotyping framework of DENV-1

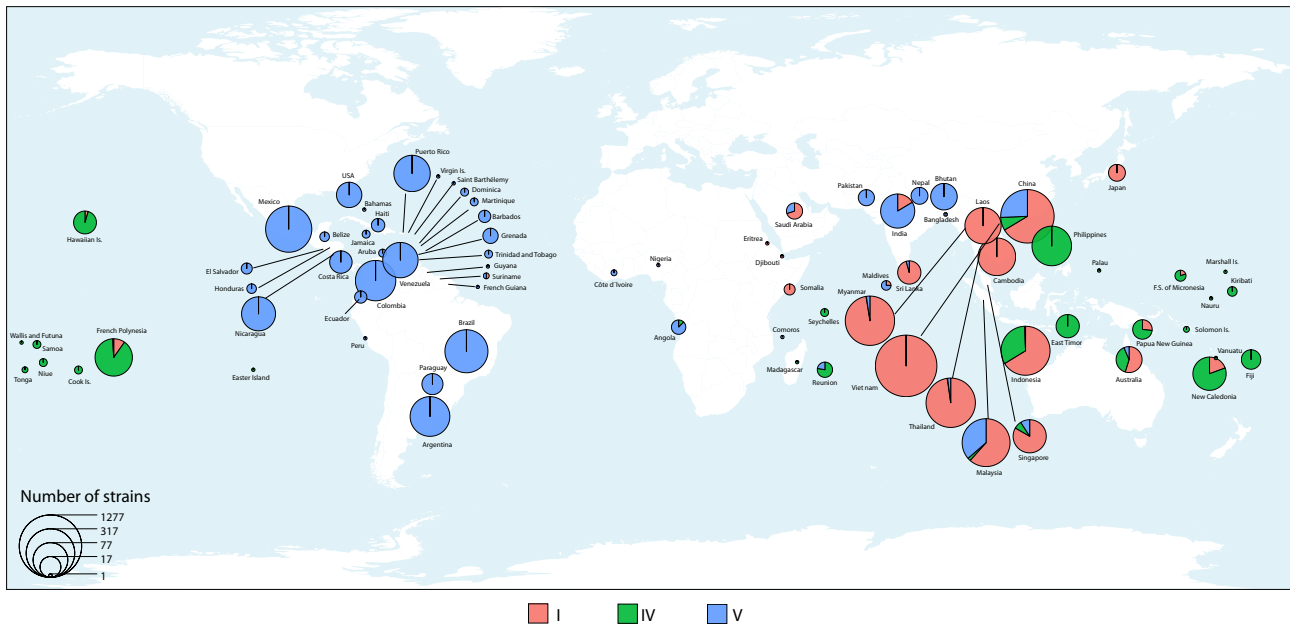

Additional file 1 Fig. S D1 Trends of global increasing expansion of DENV-1. **a**, The new isolated strains of DENV-1, **b**, new reporting DENV-1 isolation countries/areas, **c**, new emerging subgenotypes, **d**, and new emerging clades of DENV-1 were counted each five years.

Additional file 1 Table S D1 The associations between the substitution rates and tMRCAs of the included clades evaluated by the linear regression model after adjustment of the strains number, MPDs and Simpson Index.

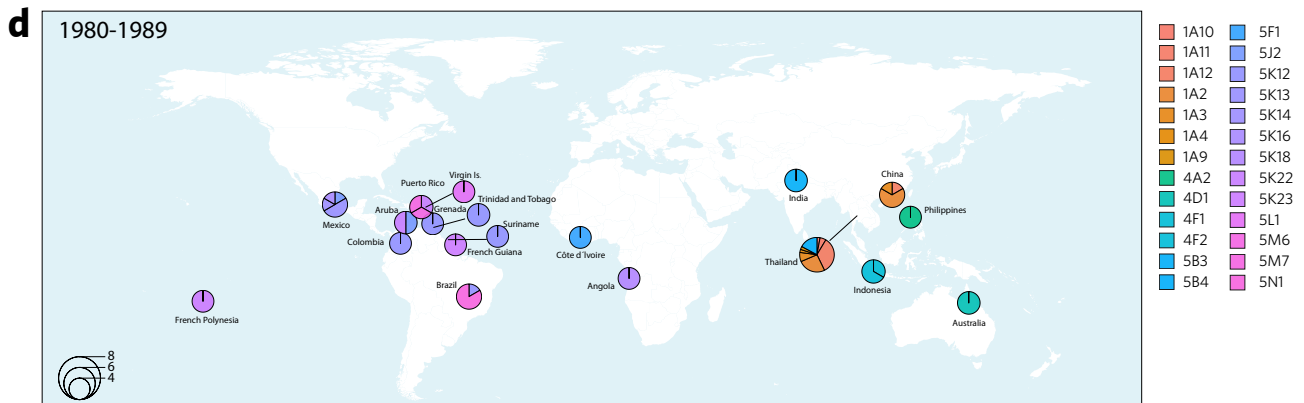

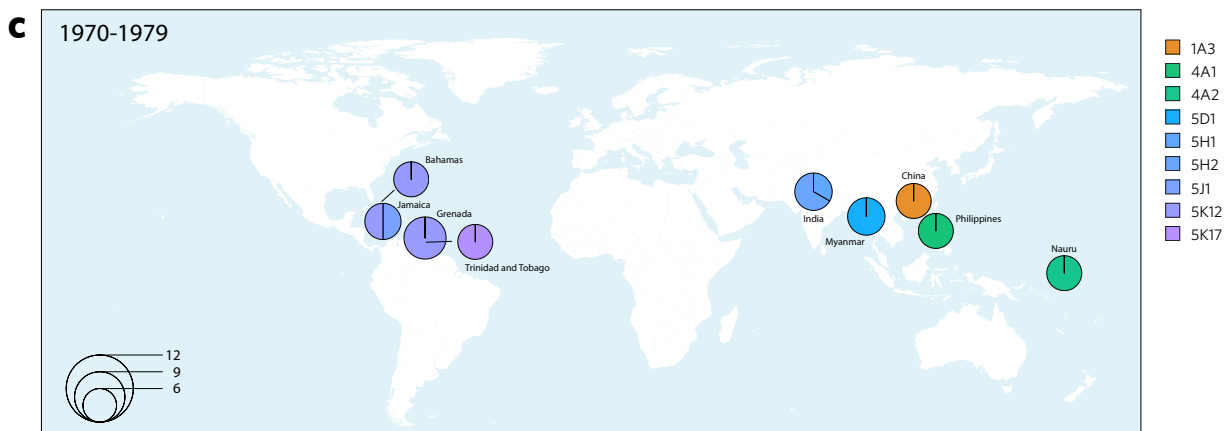

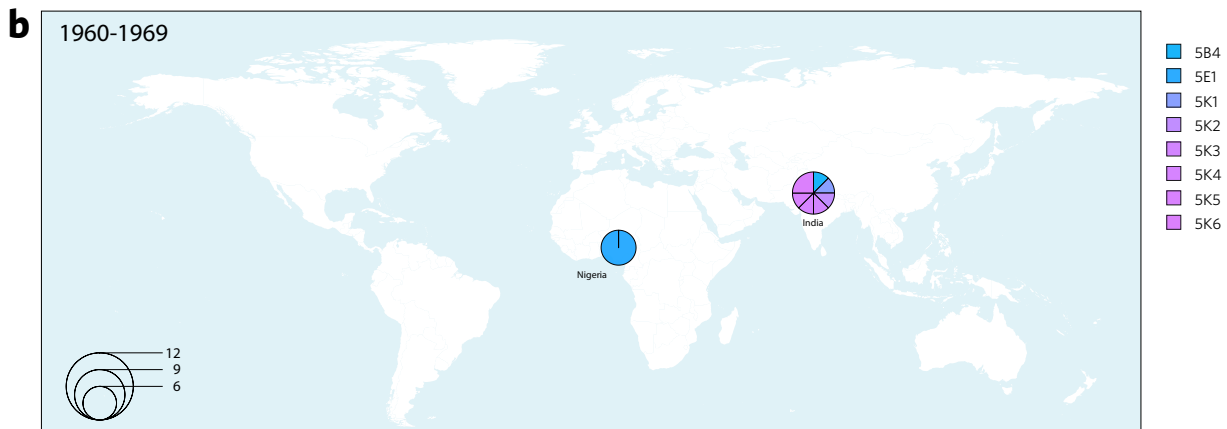

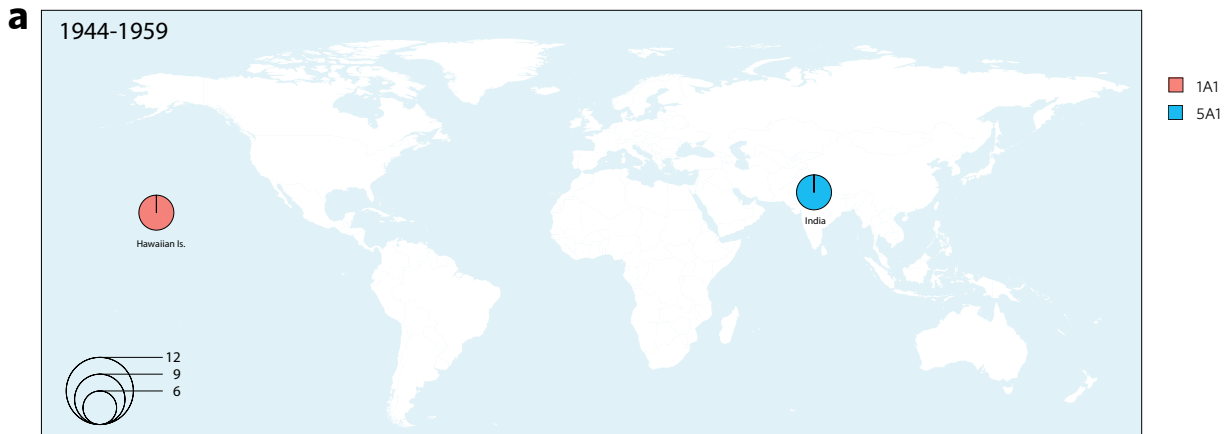

Variable	Change with substitution rate	95% CI	<i>P</i>
tMRCA	2.9×10^{-5}	(1.3 - 4.4×10^{-5})	<0.001
Number of strains	5.4×10^{-7}	(-4.4 - 15.2×10^{-7})	0.289
MPDs	1.5×10^{-2}	(-6.1 - 9.1×10^{-2})	0.703
SI	-1.6×10^{-5}	(-37.8 - 34.6×10^{-5})	0.932

tMRCA: the most recent common ancestor; MPDs: Mean pairwise distance; SI: Simpson index; CI: confidence interval

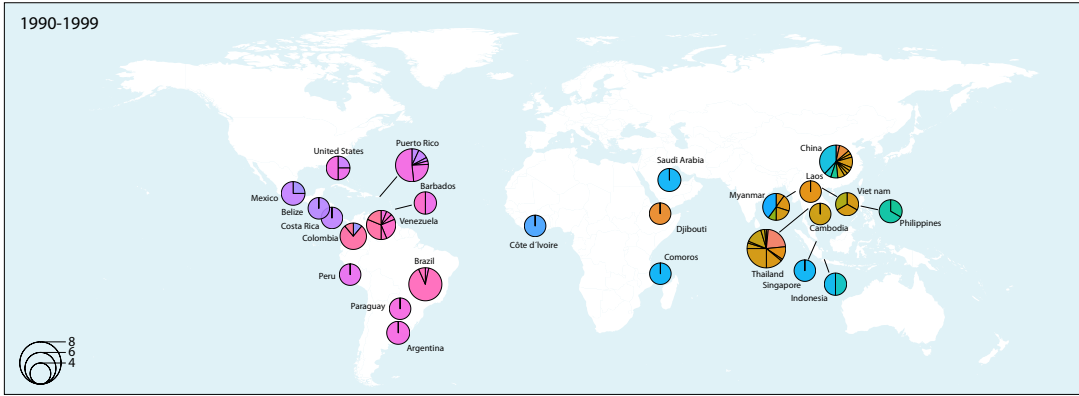

E: Global geographic distribution and epidemic regional classification.

Additional file 1 Fig. S E1 Global geographical distributions of genotype I, IV, and V of DENV-1 by countries/areas. A continental constraint at genotype level was observed, where genotype I was highly restrictively in Asia (98.2%, 2885/2939) especially in East Asia (80.1%, 2374/2939) and Southeast Asia (16.5%, 486/2939), and circulated in Red Sea region in recent years (0.5%, 14/2939). Genotype IV was mainly dispersed in island regions near the equator including Oceania (38.3%, 214/559), Malay Archipelago (51.7%, 289/559), and several Southwest Indian Ocean archipelago (2.0%, 11/559). The majority of genotype V was reported from America (72.8%, 1079/1482) and South Asian Subcontinent (8.1%, 120/1482). Meanwhile, genotypes II and III were only recorded in Asia.

e

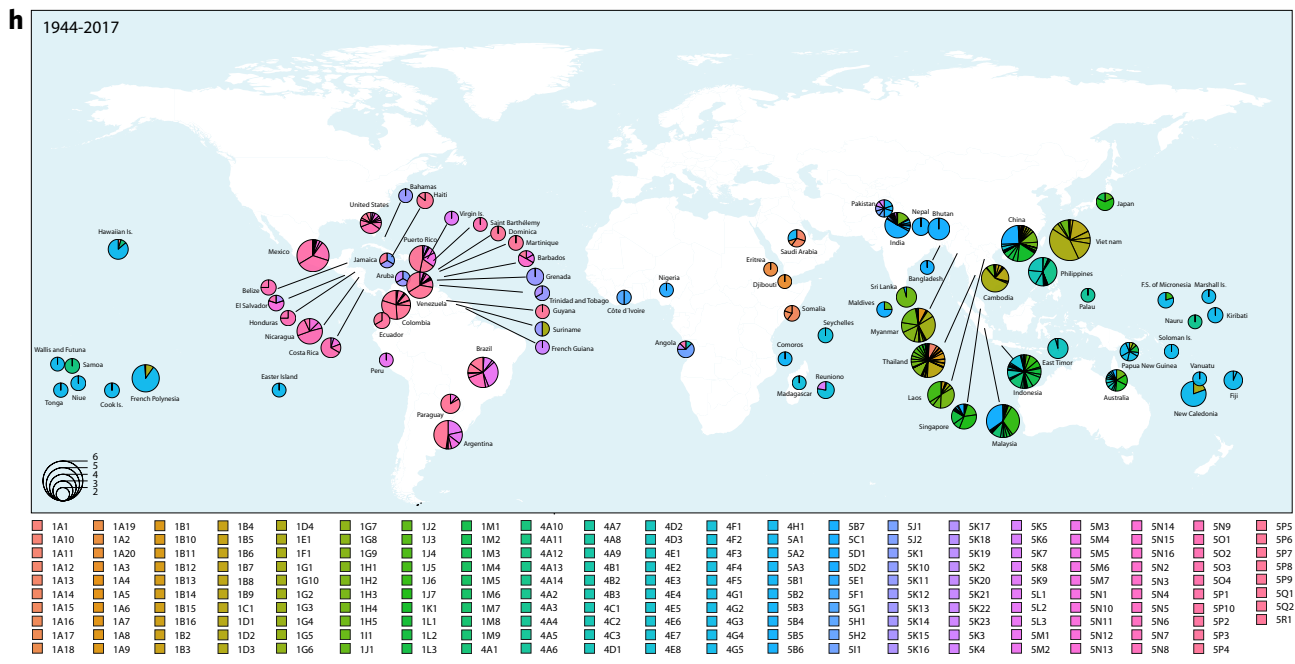

f

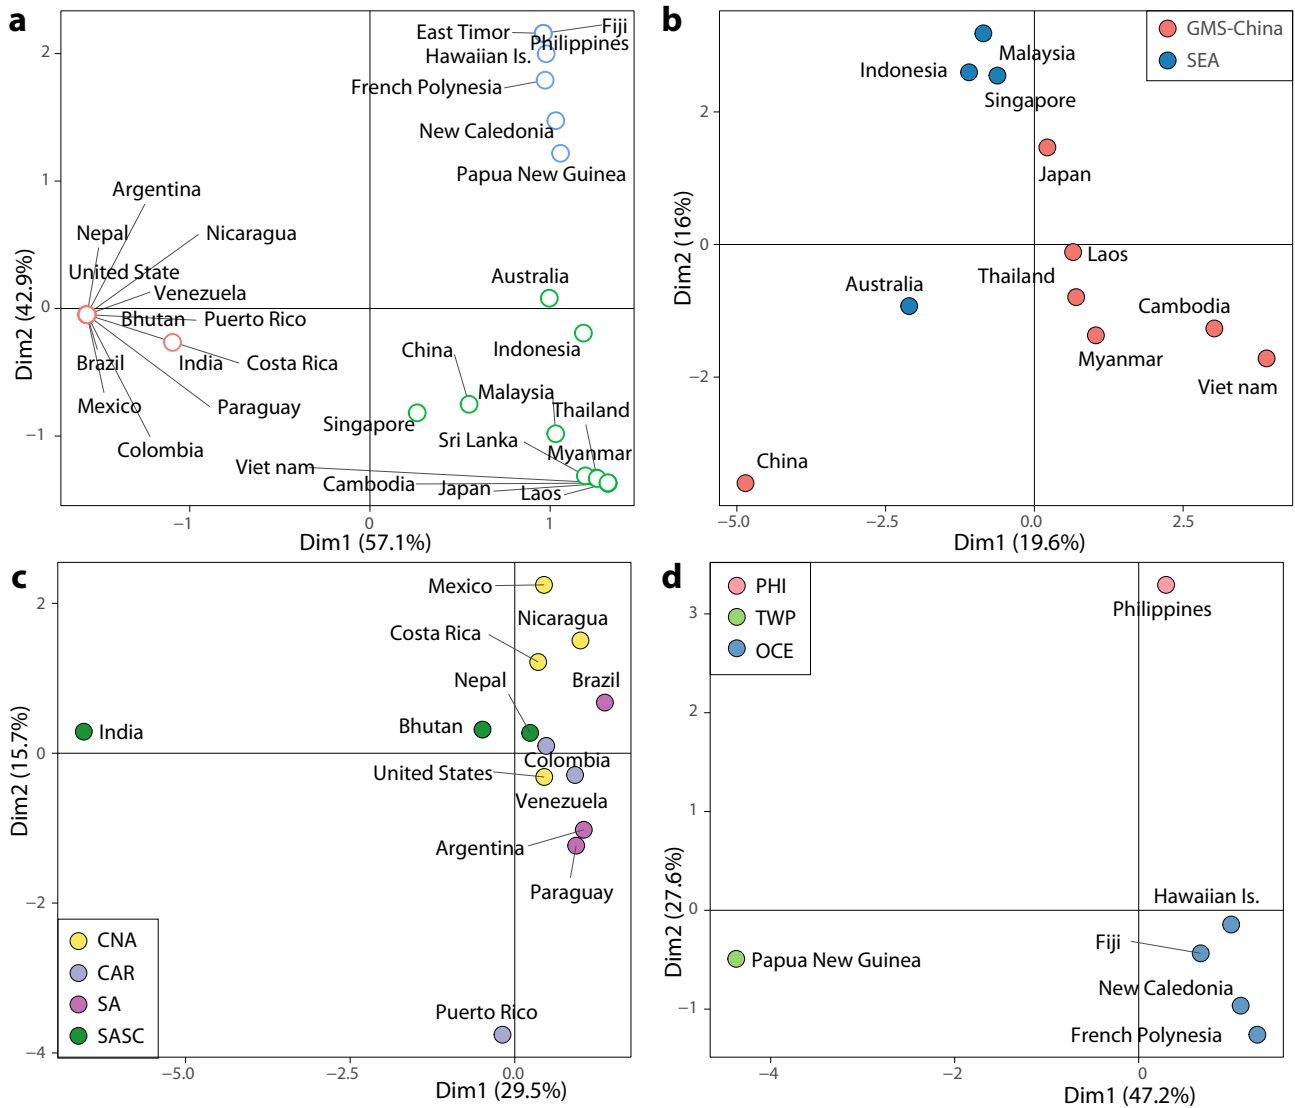

g

Additional file 1 Fig. S E2 Global spreading of DENV-1 genotype I, IV, and V clades by countries/areas from 1944 to 2017 counted by every ten years. Each panel displayed circulating clades and the corresponding countries in that period. Pies are sized to indicate the number of isolates and the colors in the pies indicate the defined clade. **a**, 1944-1959, **b**, 1960-1969, **c**, 1970-1979, **d**, 1980-1989, **e**, 1990-1999, **f**, 2000-2009, **g**, 2010-2017 **h**, 1944-2017. Before 1970s, DENV-1 isolates were reported in Hawaiian Is. (USA, 1944), Nigeria (Africa, 1968), and India (South Asian sub-continent, 1956), which indicated that DENV-1 had been epidemic in Oceania, Africa, and Asia continents, and India recorded with 8 defined clades which represented a higher population diversity of DENV-1. After 1970s, DENV-1 showed a rapid expansion, strains were firstly isolated in Jamaica, Grenada, and Bahamas in American continent in 1977, and then 50 countries/areas were instantly affected with 105 and 94 circulating clades of DENV-1 during 2000 to 2009, and 2010-2017, respectively.

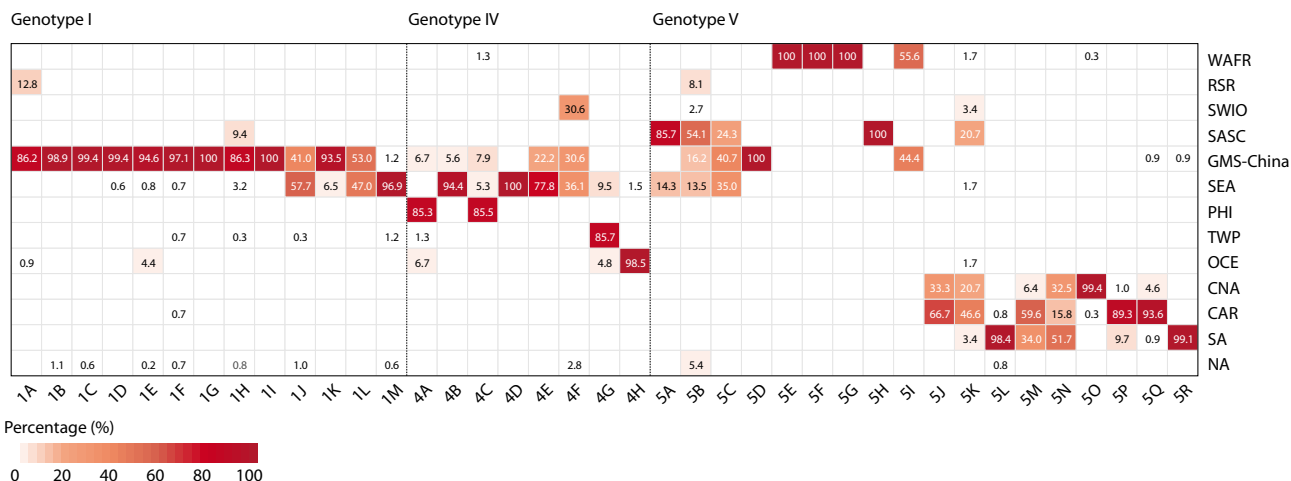

Additional file 1 Fig. S E3 Geographical hierarchical clustering of DENV-1 at the genotype and subgenotype levels. Using partitioning around medoid (PAM), which was implemented in “factoextra” package in R software, 32 countries/areas with more than 10 DENV-1 strains were selected for geographical clustering based on composition and frequencies of genotype or subgenotype. The optimal numbers of clusters were assessed and chosen using silhouette method. **a**, the preliminary three geographical clustering corresponding three genotypes were evidently continentally constraint consistent with the previous studies. According this continental separation, countries/areas within in Asia (**b**), America (**c**) and pacific islands (**d**) were further clustered at subgenotype level for high resolution of DENV-1 circulation pattern.

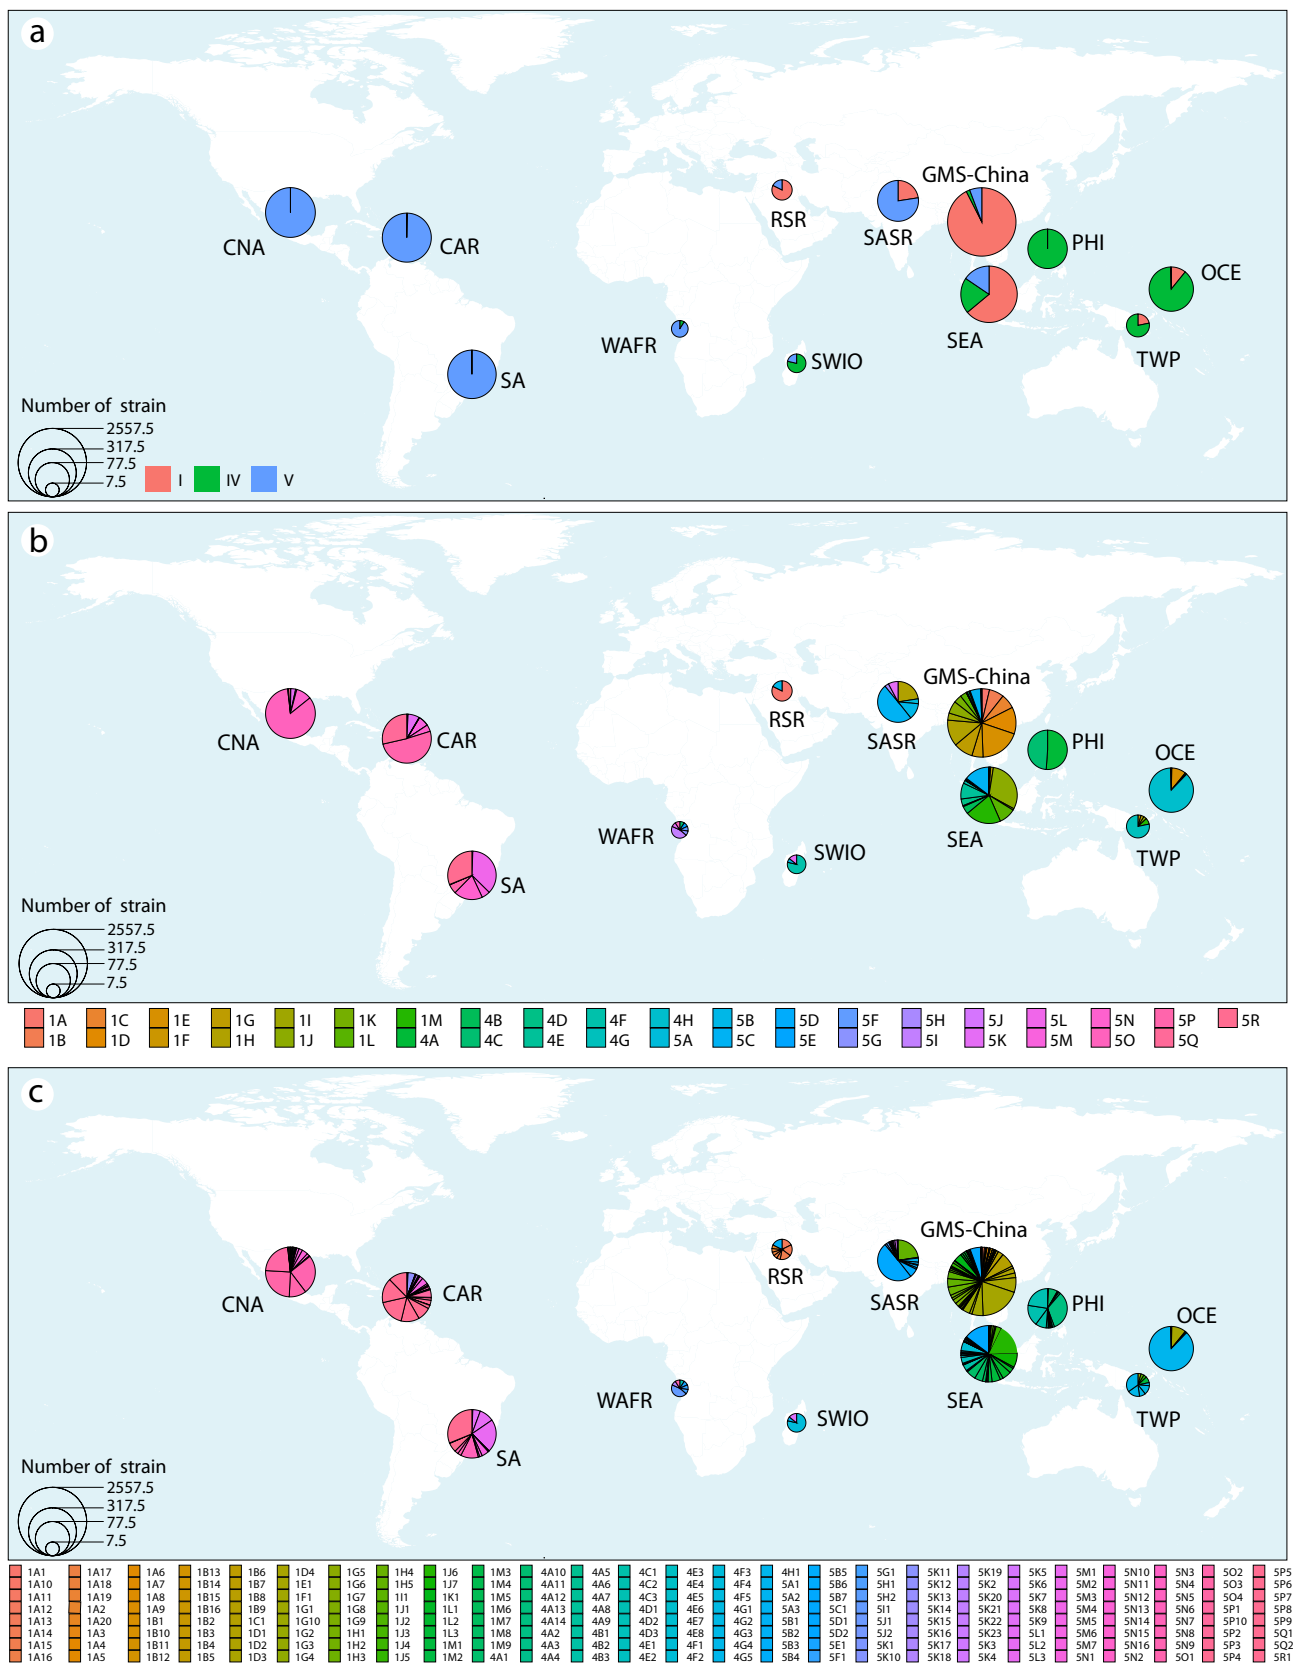

Additional file 1 Table S E1 Compositions of countries/areas in the defined 12 epidemic regions of DENV-1

Epidemic region	Abbreviation of region	Countries/areas included	Number of included countries/ areas
West African Region	WAFR	Angola, Côte d'Ivoire, Nigeria	3
Red Sea Region	RSR	Djibouti, Eritrea, Saudi Arabia, Somalia	4
Southwest Indian Ocean	SWIO	Comoros, Madagascar, Reunion, Seychelles	4
South Asia Subcontinent	SASC	Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, Sri Lanka	7
Great Mekong Subregion-China	GMS-China	Cambodia, China, Japan, Laos, Myanmar, Thailand, Vietnam	7
Southeast Asia	SEA	Australia, East Timor, Indonesia, Malaysia, Singapore	5
Philippines	PHI	Palau, Philippines	2
Tropical Western Pacific	TWP	Marshall Is., F.S. of Micronesia, Nauru, Papua New Guinea, Solomon Is.	5
Oceania	OCE	Cook Is., Easter Island, Fiji, French Polynesia, Kiribati, New Caledonia, Niue, Samoa, Tonga, Hawaiian Is., Vanuatu, Wallis and Futuna	12
Central North America	CNA	Belize, Costa Rica, Honduras, El Salvador, Mexico, Nicaragua, United States	7
Caribbean	CAR	Aruba, Bahamas, Barbados, Colombia, Dominica, Ecuador, French Guiana, Grenada, Guyana, Haiti, Jamaica, Martinique, Peru, Puerto Rico, Saint Barthélemy, Suriname, Trinidad and Tobago, Venezuela, Virgin Is.	19
South America	SA	Argentina, Brazil, Paraguay	3
Worldwide			78

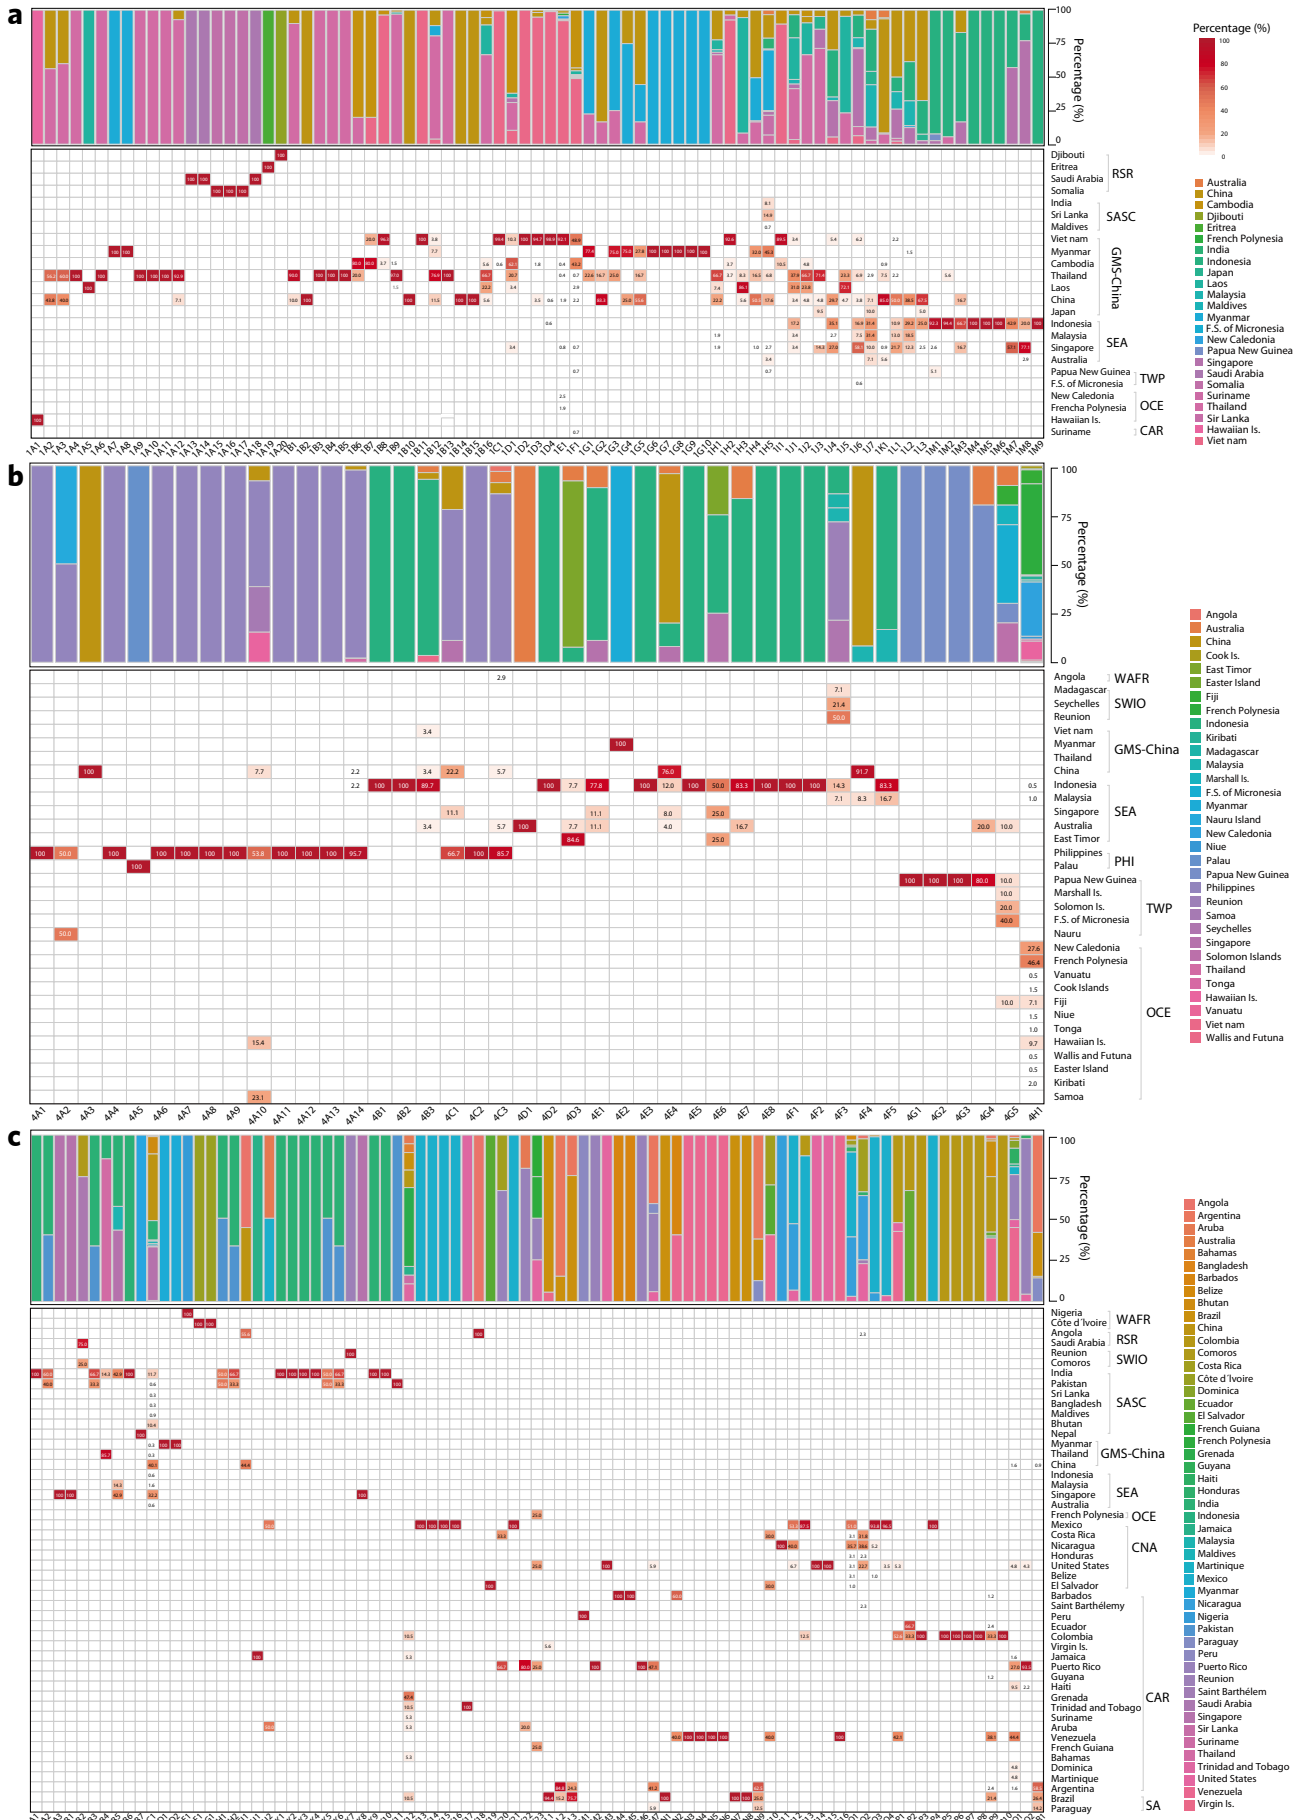

Note: Based on the first geographical clustering in Fig. S-E3, the detailed information involving epidemiology, geographical proximity, and the main epidemic subgenotype composition were thus complemented in further geographical classification. For example, due to lack of understanding of dengue epidemiologically and the probability of underreporting in African continent, where no African countries recorded more than 10 isolates of DENV-1 except only one strain reported respectively in Djibouti, Eritrea, Nigeria, Madagascar, and Comoros, but all the African countries involved and those with similar rare records of DENV-1 on other continents (46 in total) are still of high concern and then were included for the analyses of global geographical distribution.

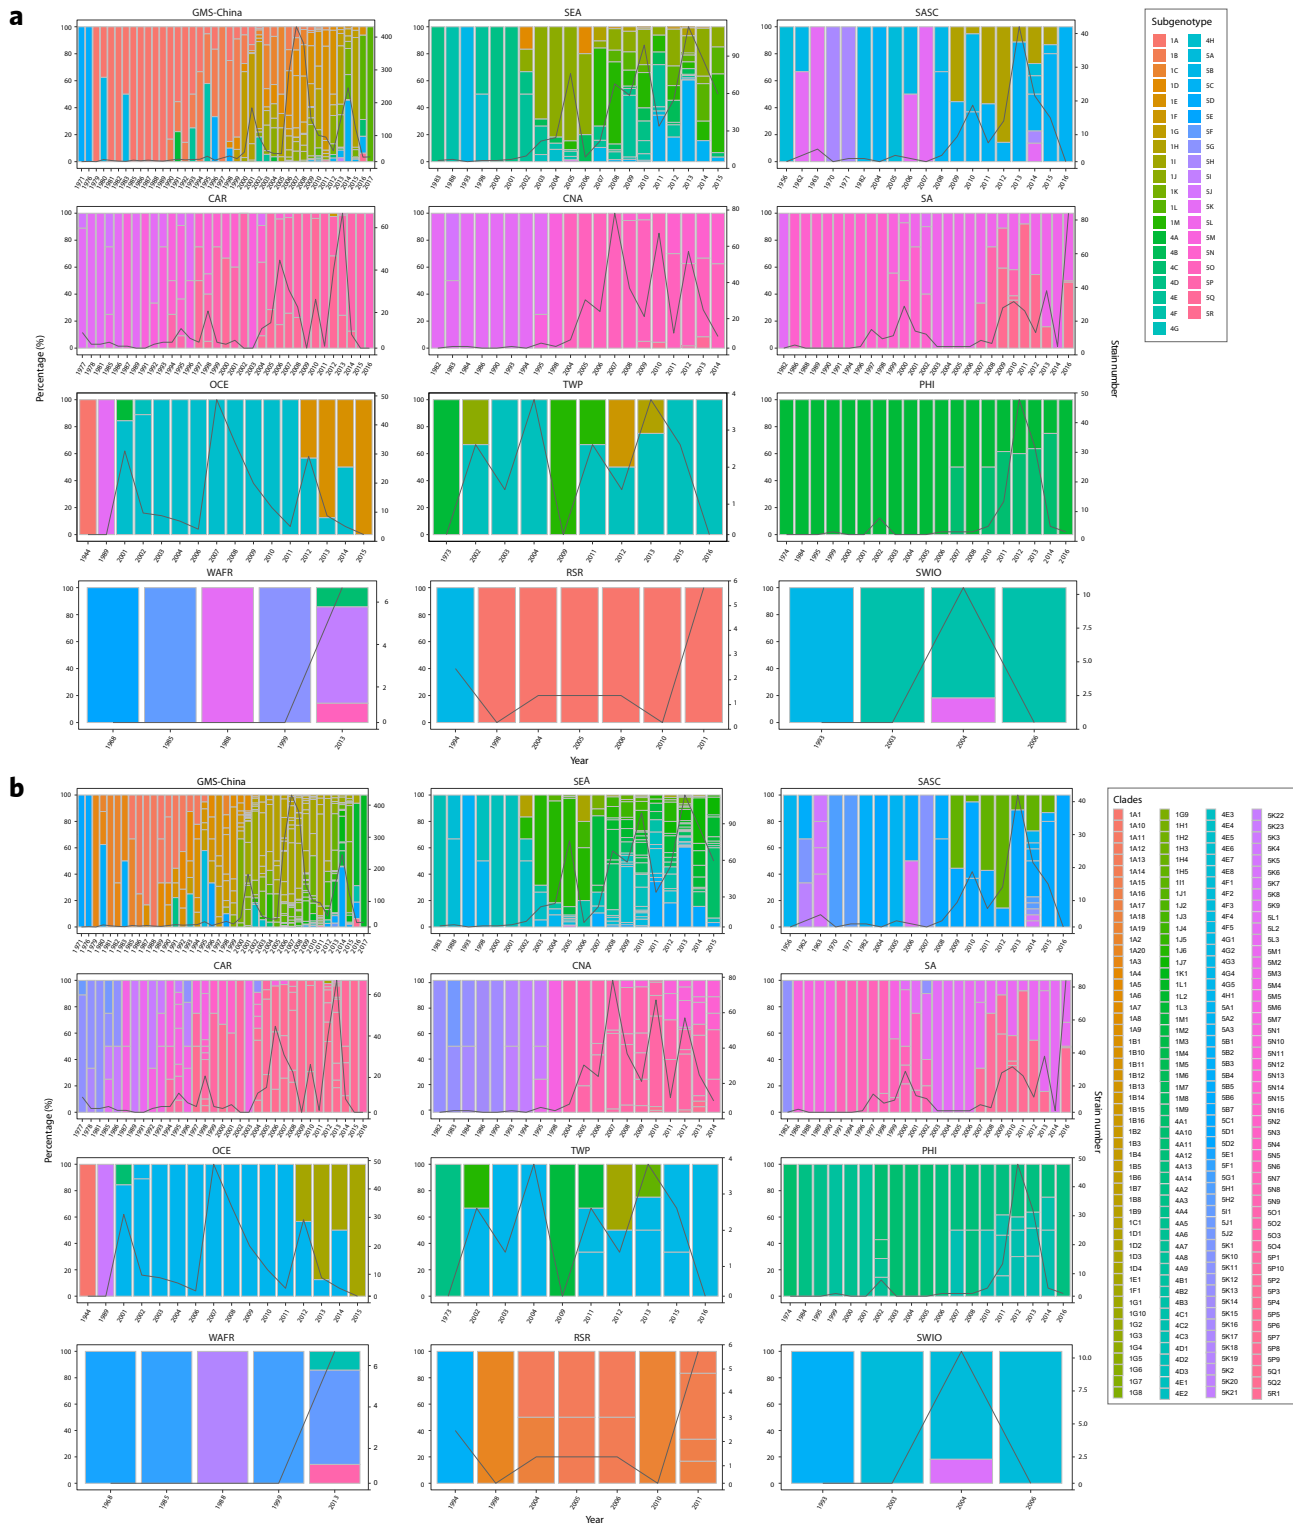

Additional file 1 Fig. S E4 Heatmap of defined clade distribution displayed by 12 epidemic regions by percentages. For certain clade, the distribution in all reported countries/areas equals 100%; the percentages in a specific region showed in the corresponding cell. Subgenotype 5K was found spreading across SEA, SASC, SA, CAR, CNA, OCE, SWIO, and WAFR, while 5B across SEA, GMS-China, SASC, SWIO, and RSR; 4F across SEA, GMS-China, and SWIO; 5C across GMS-China, SEA, and SASC; 5M and 5N across SA, CAR, and CNA. WAFR, West African Region; RSR, Red Sea Region; SWIO, Southwest Indian Ocean; SASC, South Asia Subcontinent; GMS-China, Great Mekong Subregion-China; SEA, Southeast Asia; PHI, Philippines; TWP, Tropical Western Pacific; OCE, Oceania; CNA, Central North America; CAR, Caribbean; SA, South America.

Additional file 1 Fig. S E5 Global geographical distributions of genotypes I, IV, and V of DENV-1 represent by 12 classified epidemic regions. Pies are sized to indicate the number of isolates and colors in the pies indicate genotype (a), subgenotype (b), and clade (c) compositions, respectively. Apparently, Genotypes I, IV and V presented in SEA and GMS-China, while I and IV co-circulated in SASR and RSR, I and V in OCE and TWP. WAFR, West African Region; RSR, Red Sea Region; SWIO, Southwest Indian Ocean; SASR, South Asia Subcontinent; GMS-China, Great Mekong Subregion-China; SEA, Southeast Asia; PHI, Philippines; TWP, Tropical Western Pacific; OCE, Oceania; CNA, Central North America; CAR, Caribbean; SA, South America.

Additional file 1 Fig. S E6 Heatmap of the defined clade distribution displayed by countries/areas by percentage. For a certain clade, the distribution in all reported countries/areas equals 100%; the percentage in each country/area displayed in the corresponding cell. The stacked barplot of proportion in each clade is colored by countries/areas in the panel above. **a**, Clades in genotype I of DENV-1, **b**, Clades in genotype IV of DENV-1, **c**, Clades in genotype I of DENV-1.

Additional file 1 Fig. S E7 Relatively specific circulation patterns of subgenotypes and clades in each epidemic region. Stacked barplots of proportion are colored by subgenotypes (a) and clades (b) along time in each epidemic region. WAFR, West African Region; RSR, Red Sea Region; SWIO, Southwest Indian Ocean; SASC, South Asia Subcontinent; GMS-China, Great Mekong Subregion-China; SEA, Southeast Asia; PHI, Philippines; TWP, Tropical Western Pacific; OCE, Oceania; CNA, Central North America; CAR, Caribbean; SA, South America.

F: Global transmission pattern of DENV-1 at subgenotype level

Additional file 1 Table S F1 The transmission pairs with involved subgenotypes ≥ 3

Transmission pairs	Epidemic regions	Subgenotypes involved	Number
China - Thailand	GMS_China	1A, 1B, 1G, 1J, 1K	5
China - Viet nam	GMS_China	1B, 1D, 1E, 1H, 1J	5
Argentina - Brazil	SA	5L, 5N, 5P, 5R	4
China - Indonesia	GMS_China & SEA	1L, 1M, 4B, 4E	4
Indonesia - Singapore	SEA	1L, 1M, 4E, 5C	4
Argentina - Paraguay	SA	5M, 5N, 5R	3
Australia - Indonesia	SEA	1J, 4B, 4E	3
Cambodia - Laos	GMS_China	1D, 1F, 1J	3
China - Malaysia	GMS_China & SEA	1J, 1L, 4F	3
China - Myanmar	GMS_China	1G, 1H, 5C	3
China - Singapore	GMS_China & SEA	1K, 4C, 5C	3
Mexico - United States	CNA	5N, 5O, 5P	3
Myanmar - Thailand	GMS_China	1A, 1B, 1G	3
Puerto Rico - United States	CNA & CAR	5K, 5M, 5Q	3
Singapore - Viet nam	SEA & GMS_China	1E, 1J, 1L	3
Thailand - Viet nam	GMS_China	1D, 1E, 1J	3

Additional file 1 Table S F2 The transmission pairs inferred by BSSVS from 29 DENV-1 subgenotypes

Subgenotype	Transmission pair	Bayes Factor	Transmission rate	Epidemic region
1A	China-Thailand	28270.73674	1.8204	GMS-China

Notes: Only the pairs with transmission rate ≥ 1 from the 172 pairs totally inferred in the study are showed in this table. BSSVS: the Bayesian stochastic search variable selection; WAFR, West African Region; RSR, Red Sea Region; SWIO, Southwest Indian Ocean; SASC, South Asia Subcontinent; GMS-China, Great Mekong Subregion-China; SEA, Southeast Asia; PHI, Philippines; TWP, Tropical Western Pacific; OCE, Oceania; CNA, Central North America; CAR, Caribbean; SA, South America.

Additional file 1 Fig. S F1 Estimates of 29 DENV-1 subgenotypes involving the transmission pairs inferred by BSSVS. a, Numbers of countries/areas involving the transmission pairs of each subgenotype. **b,** Estimates of migration rate in each included subgenotype. The red points and error bars show the median and the 95% Bayesian credible intervals, respectively.

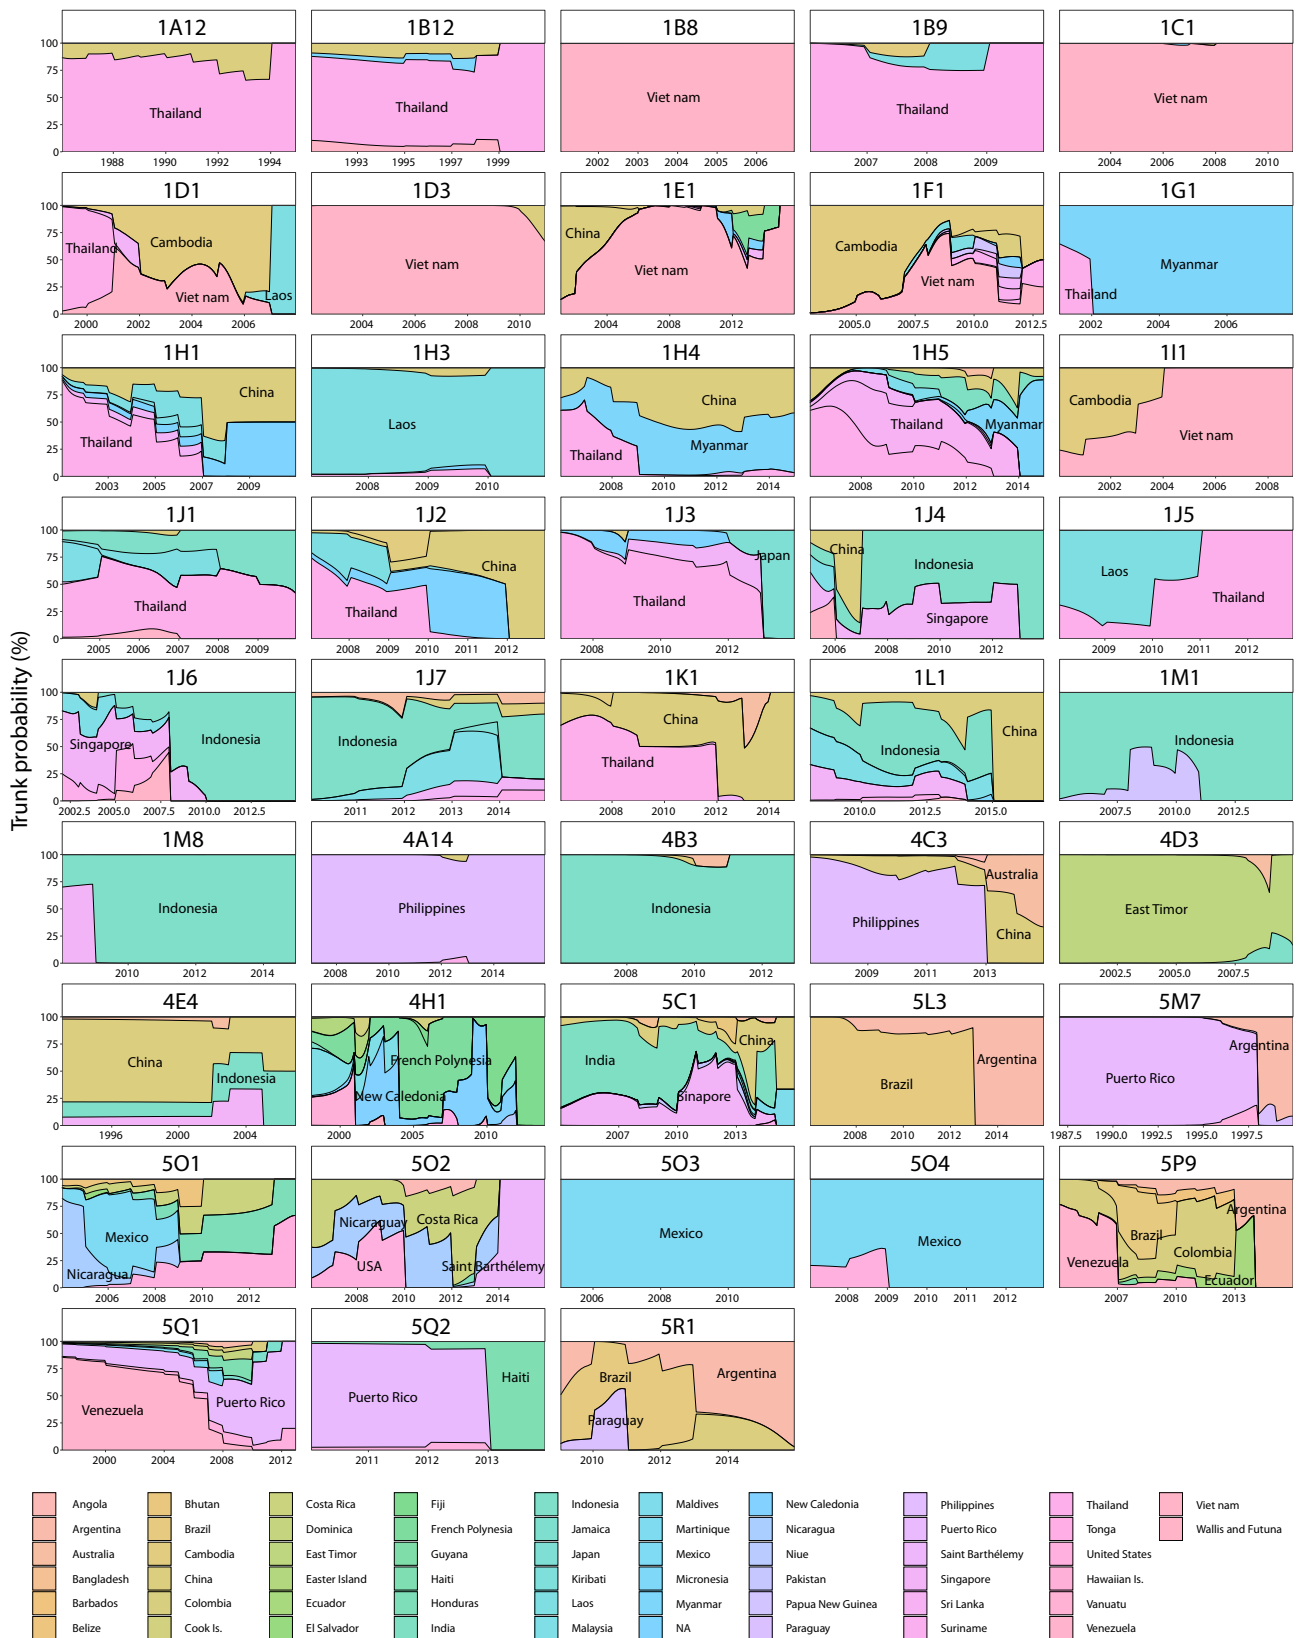

Additional file 1 Fig. S F2 DENV-1 transmission pairs in each epidemic country/area within and without its belonging epidemic regions inferred by BSSVS at the subgenotype level. a, Stacked barplots indicate the proportion of involved subgenotypes in each epidemic country/area. **b,** Numbers of involved transmission countries/areas. **c,** Stacked barplots show the proportion of epidemic regions involved transmission. WAFR, West African Region; RSR, Red Sea Region; SWIO, Southwest Indian Ocean; SASC, South Asia Subcontinent; GMS-China, Great Mekong Subregion-China; SEA, Southeast Asia; PHI, Philippines; TWP, Tropical Western Pacific; OCE, Oceania; CNA, Central North America; CAR, Caribbean; SA, South America.

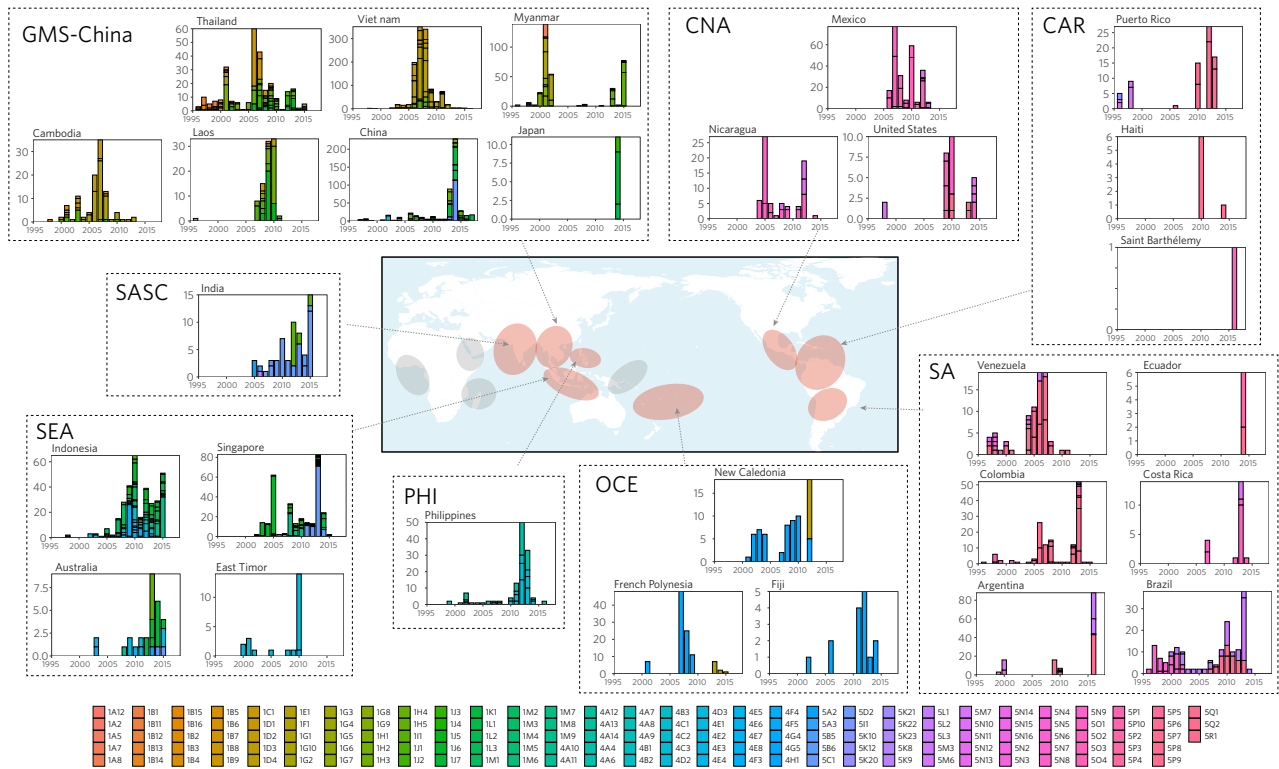

G: Sources and trend of DENV-1 diffusion at clade level

Spatiotemporal dynamics and viral diversity assessed by PACT at the clade level

For demonstration of spatiotemporal dynamics and global epidemic patterns of DENV-1 at the clade level, PACT was used in the present study as a further extension of the BEAST analyses described above. Consequently, through inferring the trunks of epidemic countries/areas by time and coalescent estimation of migration rates of the involved 43 clades, including 26, 6 and 11 clades from genotypes I, IV and V of DENV-1, respectively, only those with a trunk probability >50% in certain clade in at least 12 consecutive months were estimated by PACT as the dominant epidemic locations (Fig.4, Fig. S G1). As shown in Fig. S-G1, it was obvious that the clades 1B8, 1C1 and 1D3 mainly persisted in Vietnam, 1G1 in Myanmar, 1H3 in Lao, 1M8 and 4B3 in Indonesia, 4A14 in the Philippines, 4D3 in East Timor, 5O3 and 5O4 in Mexico.

Additional file 1 Fig. S G1 Dynamic changes of trunks representing the proportion of PACT-inferred dominant epidemic countries/areas for each DENV-1 clade circulation. A total of 43 clades of DENV-1 were estimated by PACT. Coloured width at each time point indicates the posterior support for the DENV-1 clade circulating in the inferred dominant epidemic countries/areas, while colors indicate the countries/areas. PACT: posterior analysis of coalescent trees.

Additional file 1 Fig. S G2 Temporal dynamics of clades in 28 PACT-inferred dominant countries/areas. In each panel, the stacked barplots show reported sequences numbers, and the bars are colored to indicate the defined clades. The panels share the same x-axes (1995-2017), while the y-axes vary the corresponding maximum reported sequences number of source centers. SASC, South Asia Subcontinent; GMS-China, Great Mekong Subregion-China; SEA, Southeast Asia; PHI, Philippines; OCE, Oceania; CNA, Central North America; CAR, Caribbean; SA, South America

Additional file 1 Table S G1 The status of 28 PACT-inferred dominant epidemic countries/areas and the clades of DENV-1 involved

No	Epidemic region	Country/area	Involved DENV-1 clades inferred by PACT (Persisting years)	Clade numbers
1		Thailand	1A12(1986-1994), 1B9(2006-2009), 1B12(1991-2000), 1D1(1999-2000), 1G1(2001), 1H1(2001-2004), 1H4(2006-2007), 1H5(2006-2007), 1J1(2004-2008), 1J2(2007-2008), 1J3(2007-2012), 1J5(2010-2012), 1K1(2006-2011)	13
