

Supplementary Figure 4. Retinal fluid volume-time curves for study eye 4 OS

The eye received an injection of aflibercept 10 days prior to the beginning of the study period. No or minimal subretinal fluid (SRF) was identified during the first 2 weeks of the study period. SRF appeared approximately 4 weeks after the last injection and increased gradually, while fluctuating, over the following 2 weeks, to approximately 30 nl at the end of the study period. No intraretinal fluid (IRF) was identified during the study period.
