SUPPLEMENTAL INFORMATION

for the article

The iron-sulfur cluster is essential for DNA binding by human DNA polymerase $\boldsymbol{\epsilon}$

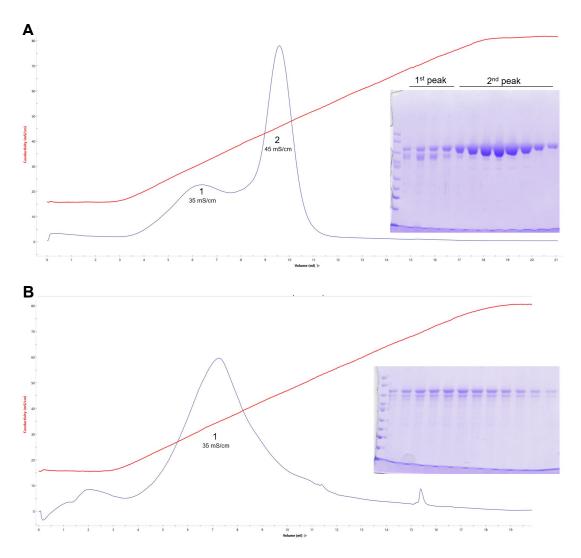

Figure S1. Heparin elution profiles of hPol_{ECD} (A) and hPol_{ECD}^M (B). Heparin HiTrap HP column (Cytiva, 1 ml) was eluted by 15 ml gradient of 0.15 - 0.8 M NaCl. Peak fractions were analyzed by 8% SDS-PAGE and stained by Coomassie Brilliant Blue R-250. The mutant elutes as a wide peak and at lower salt concentration than wild-type hPol_{ECD}, resulting in contamination with a proteolyzed form.

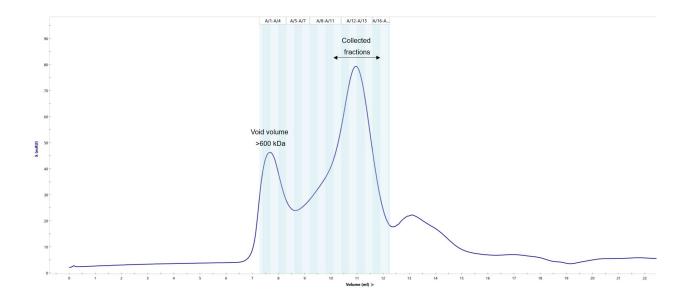

Figure S2. Elution profile of hPol ε_{CD}^{M} on Superose 12 size exclusion column. Superose 12 10/300 GL (Cytiva) has a bed volume of 24 ml and an exclusion limit of 300 kDa for globular proteins. The chromatography was conducted at 4°C in the buffer containing 25 mM Tris-HEPES (pH 7.8), 0.15 M NaCl, 1% glycerol, and 2 mM TCEP.
