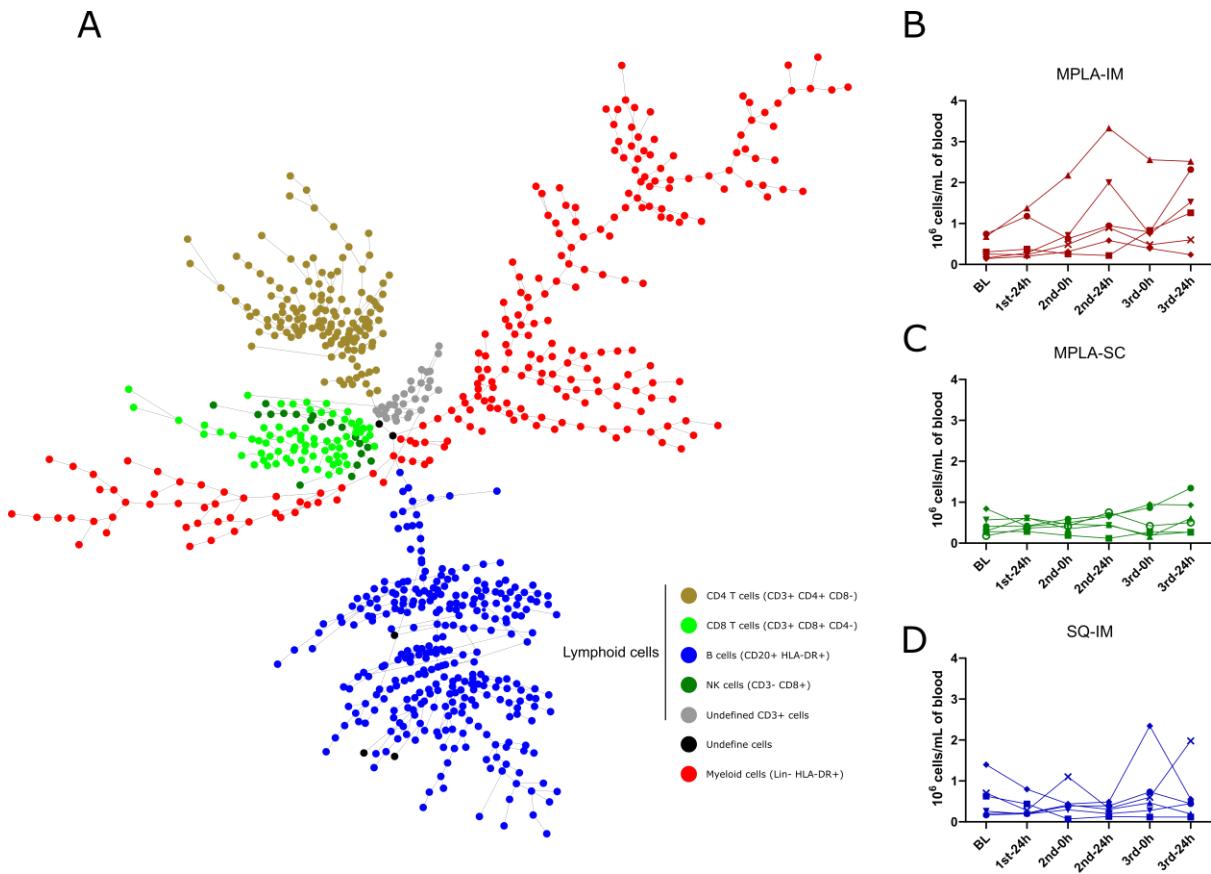

**Figure S1. Formulation of ConM SOSIP.v7 with MPLA and SQ adjuvants (related to figure 2).** D7324-tagged ConM SOSIP.v7 was incubated with the corresponding adjuvant for 1 h at 37°C and the antigenicity (**A**, **B**) and morphology (**C**, **D**) were subsequently assessed by D7324-capture ELISA and negative-stain electron microscopy, respectively. (**C**) Electron micrographs of ConM SOSIP.v7 plus adjuvants; White, blue and red circles identified respectively trimers, Squalene and MPLA. (**D**) 2D-class averages of ConM SOSIP.v7 proteins in formulations. Percentage of native-like/non-native trimers (see *Materials and Methods*) are listed below each set of class averages.

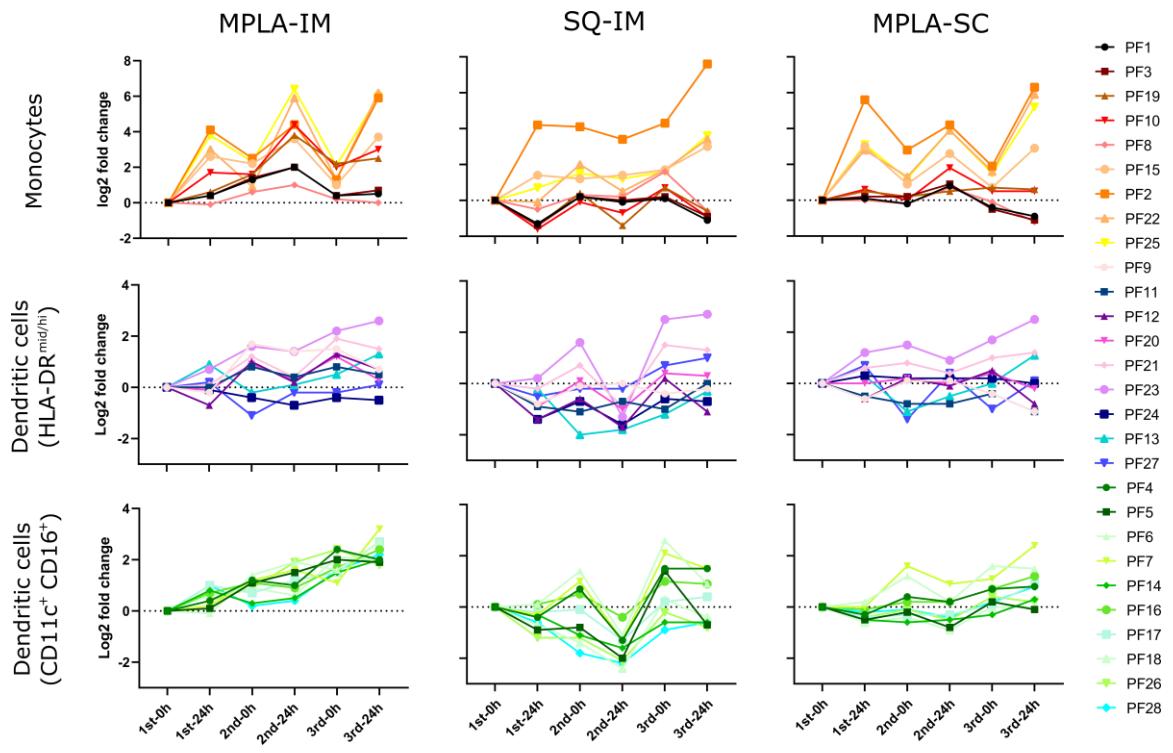

**Figure S2. Individual ConM SOSIP v7 humoral responses (related to figure 2).** ConM IgG binding and neutralizing titers of cynomolgus macaques from the MPLA-IM (A), MPLA-SC (B), and SQ-IM (C) groups, with red, green, and blue shading, respectively. Immunizations (week 0, 8, and 24) are indicated by the red arrows.

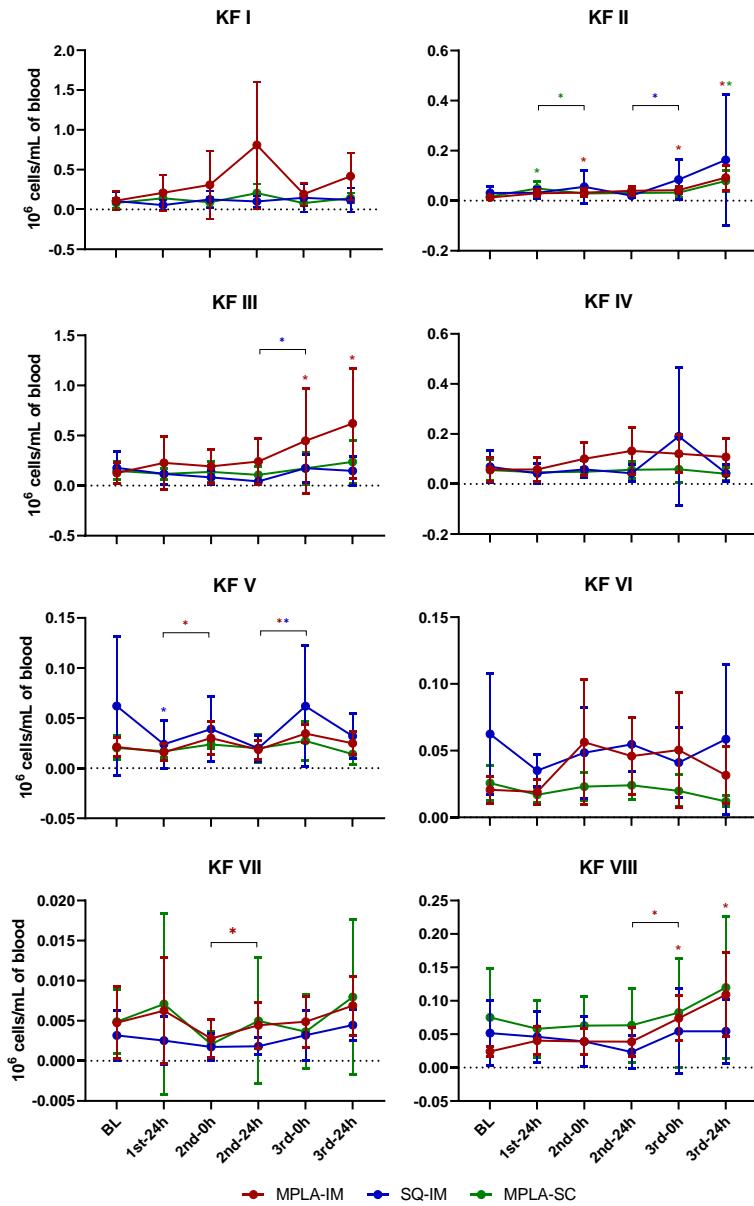

**Figure S3: Heterologous neutralization against MW965 virus (related to figure 2).** MW965 neutralizing titers were measured at week (W)28. Animals from the MPLA-IM group are displayed in red, the MPLA-SC group in green, and the SQ-IM group in blue. The geometric mean and geometric SD are represented. Comparison realized with a Mann-Whitney-Wilcoxon test with  $p$ .values  $< 0.05$  are displayed.

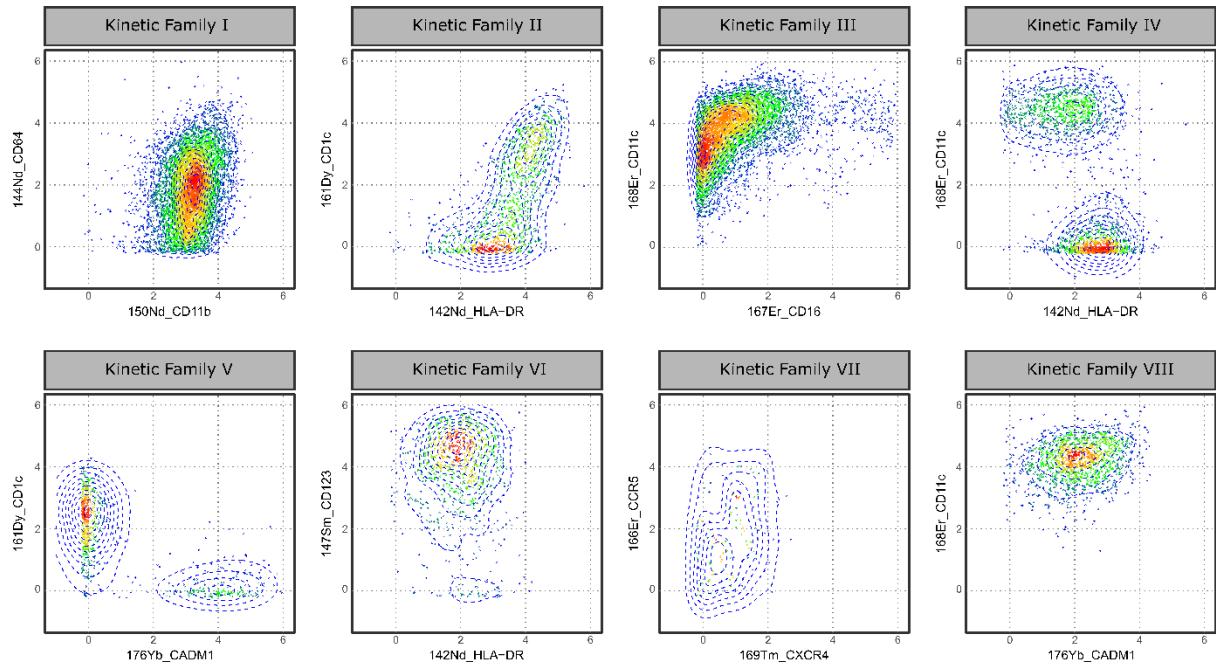

**Figure S4. Identification of major cell populations using the SPADE clustering method following immunizations with SOSIP v7 ConM (related to figure 3).** (A) SPADE tree created using the entire mass cytometry data set. Each dot represents a cell cluster. Major cell populations are annotated according to their phenotype: B cells ( $CD20^+ HLA-DR^+ CD1c^+$ ), T cells ( $CD3^+ CD4^+$  or  $CD8^+$ ), NK cells ( $CD3^- CD8^+$ ), undefined lymphocytes ( $CD3^+ CD4^- CD8^{low/-}$ ), and undefined cells. All remaining cell clusters are considered to be myeloid cells. Phenotypically similar clusters were linked using a minimal spanning-tree approach of the SPADE algorithm. Kinetics of the myeloid cells compartment depending on the vaccine: (B) MPLA-IM, (C) MPLA-SC and (D) SQ-IM.

**Figure S5. Variation of phenotypic families following immunization (related to figure 4).**  
Mean log<sub>2</sub> fold changes relative to the baseline values are displayed for each superfamily. Each color is assigned to a phenotypic family according to the colors defined in the heatmap (Fig.3).

**Figure S6. Dynamics of kinetic families following vaccine injections (related to figure 5).** Phenotypic families were regrouped by similar dynamics to form eight kinetic families. The graphs show the mean cell number per mL of blood for all individuals ( $n=6$ ) for each injection (MPLA-IM in red, MPLA-SC in green, and SQ-IM in blue). Significant differences relative to baseline values are indicated by a star and black lines are used to show significant differences compared to the previous time-point. P-values are shown in Table S2.

**Figure S7: Main characteristics of kinetic families expression profiles (related to figure 5).** Each dotplot represents the mean signal intensity (MSI) of all cells contained by a kinetic family (KF) without vaccines segregation. Markers are chosen according to the main population characteristics as defined in Table 1.

**Table S1. p-values of differences in cell numbers within phenotypic families (related to figure 4).** Comparisons were made using the Mann-Whitney Wilcoxon test. P-values  $\leq 0.05$  are shown in red.
