Cytotoxicity assay

The following flow cytometry antibodies were obtained from eBiosciences, anti-CD3 PerCP, anti-CD107a APC, anti-CD16 AF700, anti-IFN γ BV421, Annexin V BV711, anti-CD56 PE, anti-CD8 PE-TxR and anti-TNF α PE-Cy7.

CFSE labelled target cells (K562 cell line, U266 cell line) were incubated in a 1:1 ratio with BMMCs for 5 hours with protein transport inhibitor (2ul/ml, e-biosciences) added for the final 4 hours. Following incubation cells were stained with zombie yellow viability dye (Biolegend) as per manufacturer's protocol. For cell surface staining, cells were washed and re-suspended in a pre-titrated antibody mastermix for 20 minutes. For intracellular staining, cells were washed and incubated in lysis buffer (Biolegend) for 10 minutes then permeabilisation solution (BD) for 30 minutes. Fully stained samples were washed and re-suspended in FACS buffer (phosphate buffered saline supplemented with 2% FCS (Life Tech)). Data was acquired using a Fortessa 2 cytometer (BD Biosciences).
