

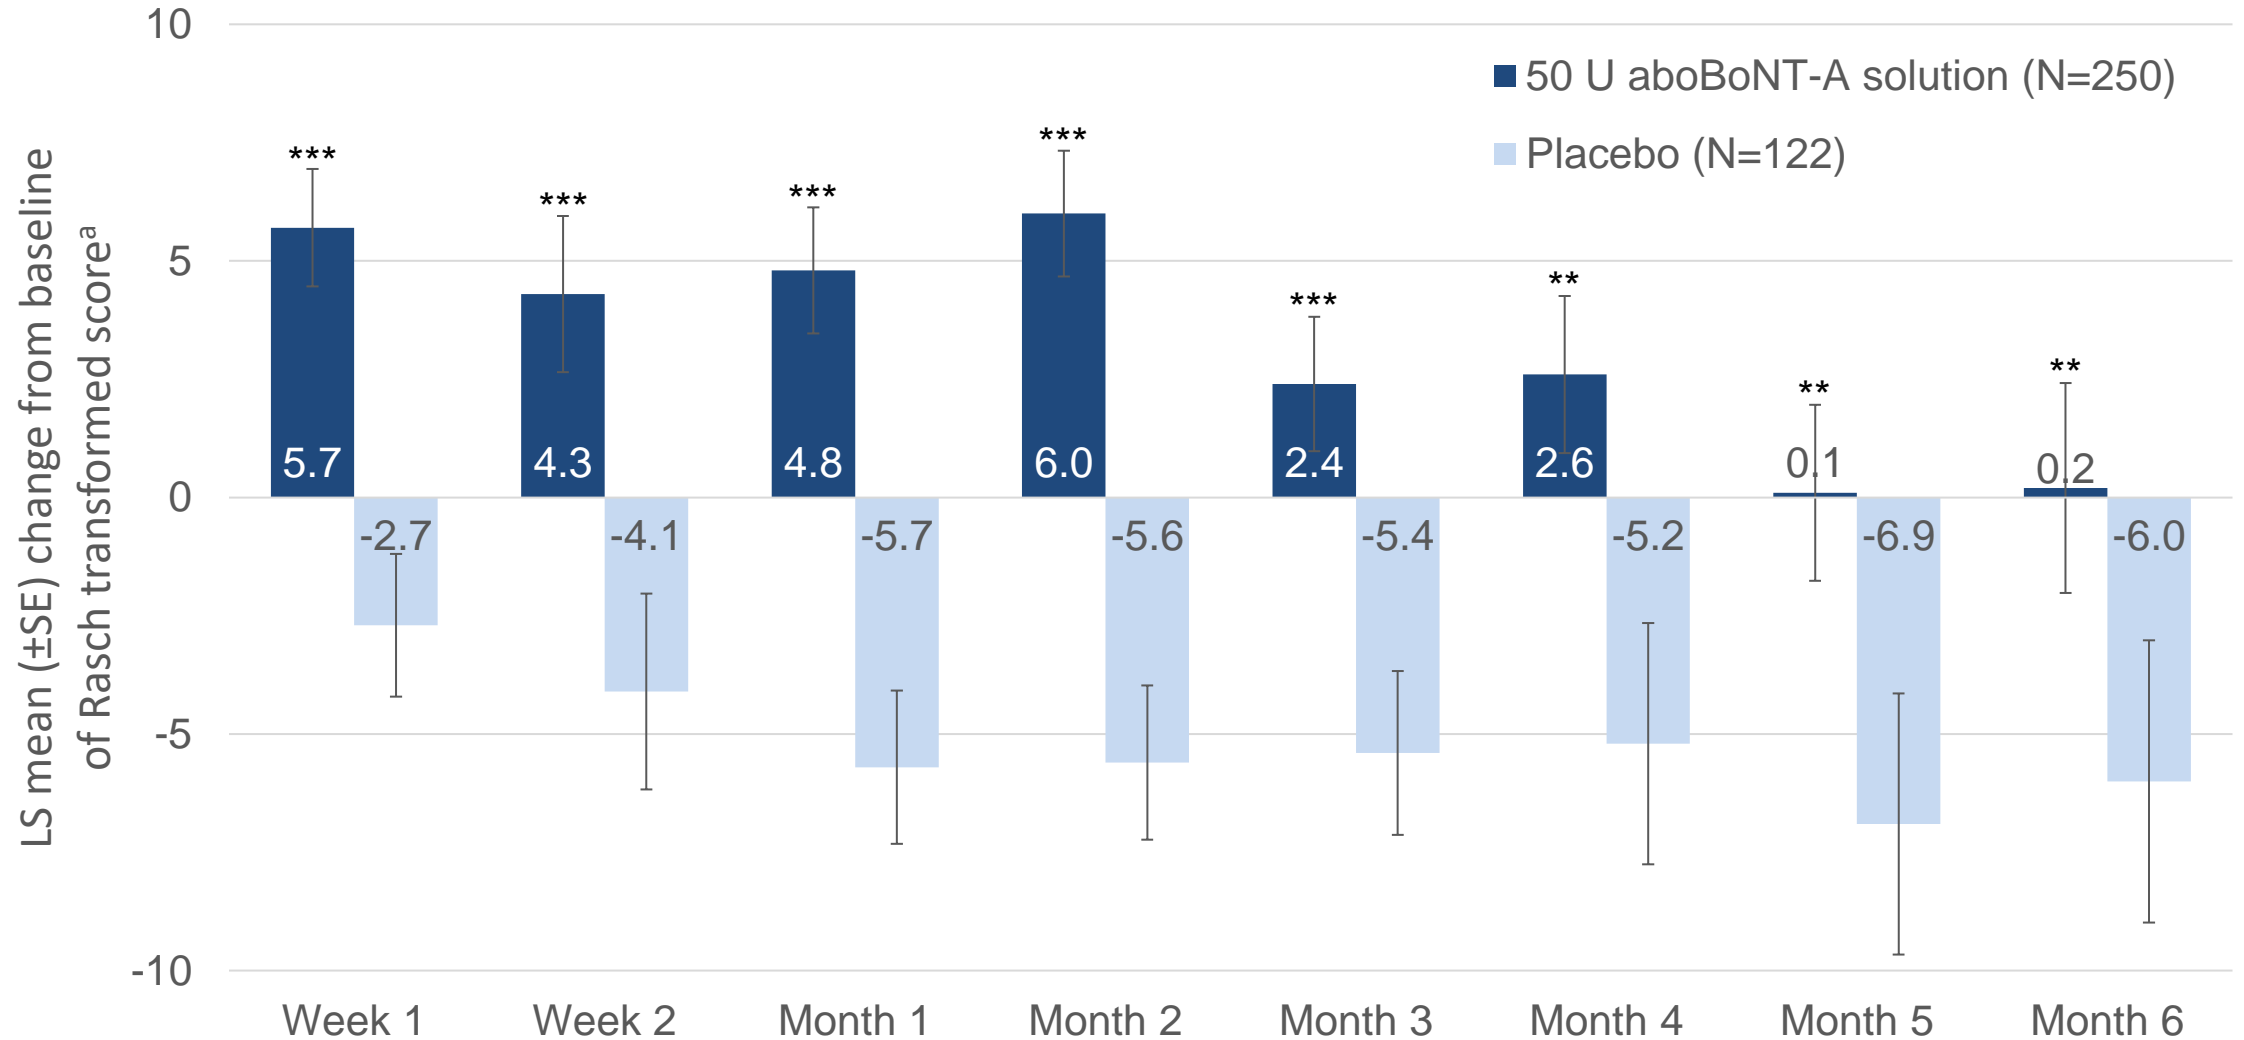

**Figure S3: Subjects' psychological well-being (change in FACE-Q total score), mITT population**

LS mean: least squares mean, SE: standard error; \*\*p<0.01 versus placebo; \*\*\*p≤0.0001 versus placebo

<sup>a</sup>The scale comprised 10 items, each rated on a 4-point scale from 'definitely disagree' (1) to 'definitely agree' (4). A greater positive change in the Rasch-transformed total score of the 10 items reflects a better outcome.

1/51 subject in the placebo group was excluded from analysis at Month 6 post-hoc as it was assessed that the subject had reversed their rating.
