**Figure S4: Subject satisfaction with facial appearance overall (change in FACE-Q total score), mITT population**

LS mean: least squares mean, SE: standard error; *p<0.05 versus placebo, **p<0.01 versus placebo, ***p<0.0001 versus placebo

a The scale comprised 10 items, each rated on a 4-point scale from 'very dissatisfied' (1) to 'very satisfied' (4). A greater positive change in the Rasch-transformed total score of the 10 items reflects a better outcome.

1/51 subject in the placebo group was excluded from analysis at Month 6, post-hoc, as it was assessed that the subject had reversed their rating.
