

File name: Supplementary Movie 1

Description: Morph between known TMEM16F structures defining a pathway towards activation. The video shows a single subunit in two different orientations. The protein is displayed as ribbon, with selected α -helices shown in unique colors (α 3 red, α 4 green, α 6 blue). C α positions of F518, W619 and Q623, which interact in the active conformation, are shown as red spheres. Membrane boundaries are indicated.
