

Supplemental Text

Table 1. Patient characteristics

	MGUS (n=9)	SMM (n=7)	MM (n=10)
Median age at diagnosis (min-max)	57 (41-80)	64 (34-71)	62 (51-79)
Race			
Caucasian	89% (8)	86% (6)	90% (9)
African American	0% (0)	14% (1)	10% (1)
unknown	11% (1)	0% (0)	0% (0)
Gender			
Male	55% (5)	29% (2)	90% (9)

Table 2. Cosine similarity between scRNA seq data and flow cytometry results

	MGUS	SMM	MM	all
B	0.91	0.93	0.99	0.90
T	0.97	0.99	0.99	0.98
NK	0.86	0.79	0.92	0.80
Mono	0.95	0.97	0.99	0.96

Table 3. Cell proportions per sample in each disease stage

Figure 1. Quantitative alterations of distinct cell subsets from progression of monoclonal gammopathy of undetermined significance (MGUS) to smoldering MM (SMM) (**A**), SMM to MM (**B**) and MGUS to advanced stages (ADV= SMM and MM, **C**) and precursor stages (MGUS/SMM) to newly diagnosed MM (NDMM) in each dataset and the combined data. Significance is shown in black asterisks for the single datasets and in red for the combined dataset.

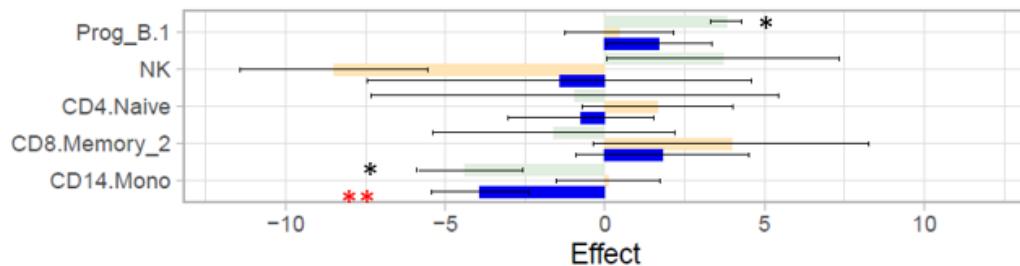

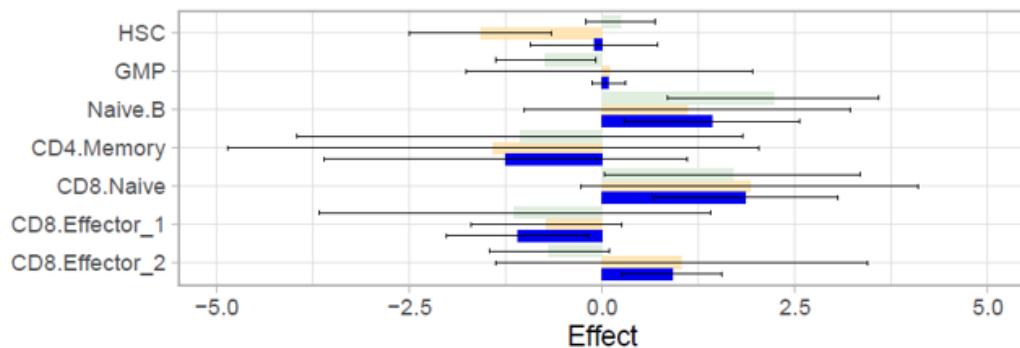

A

MGUS → SMM

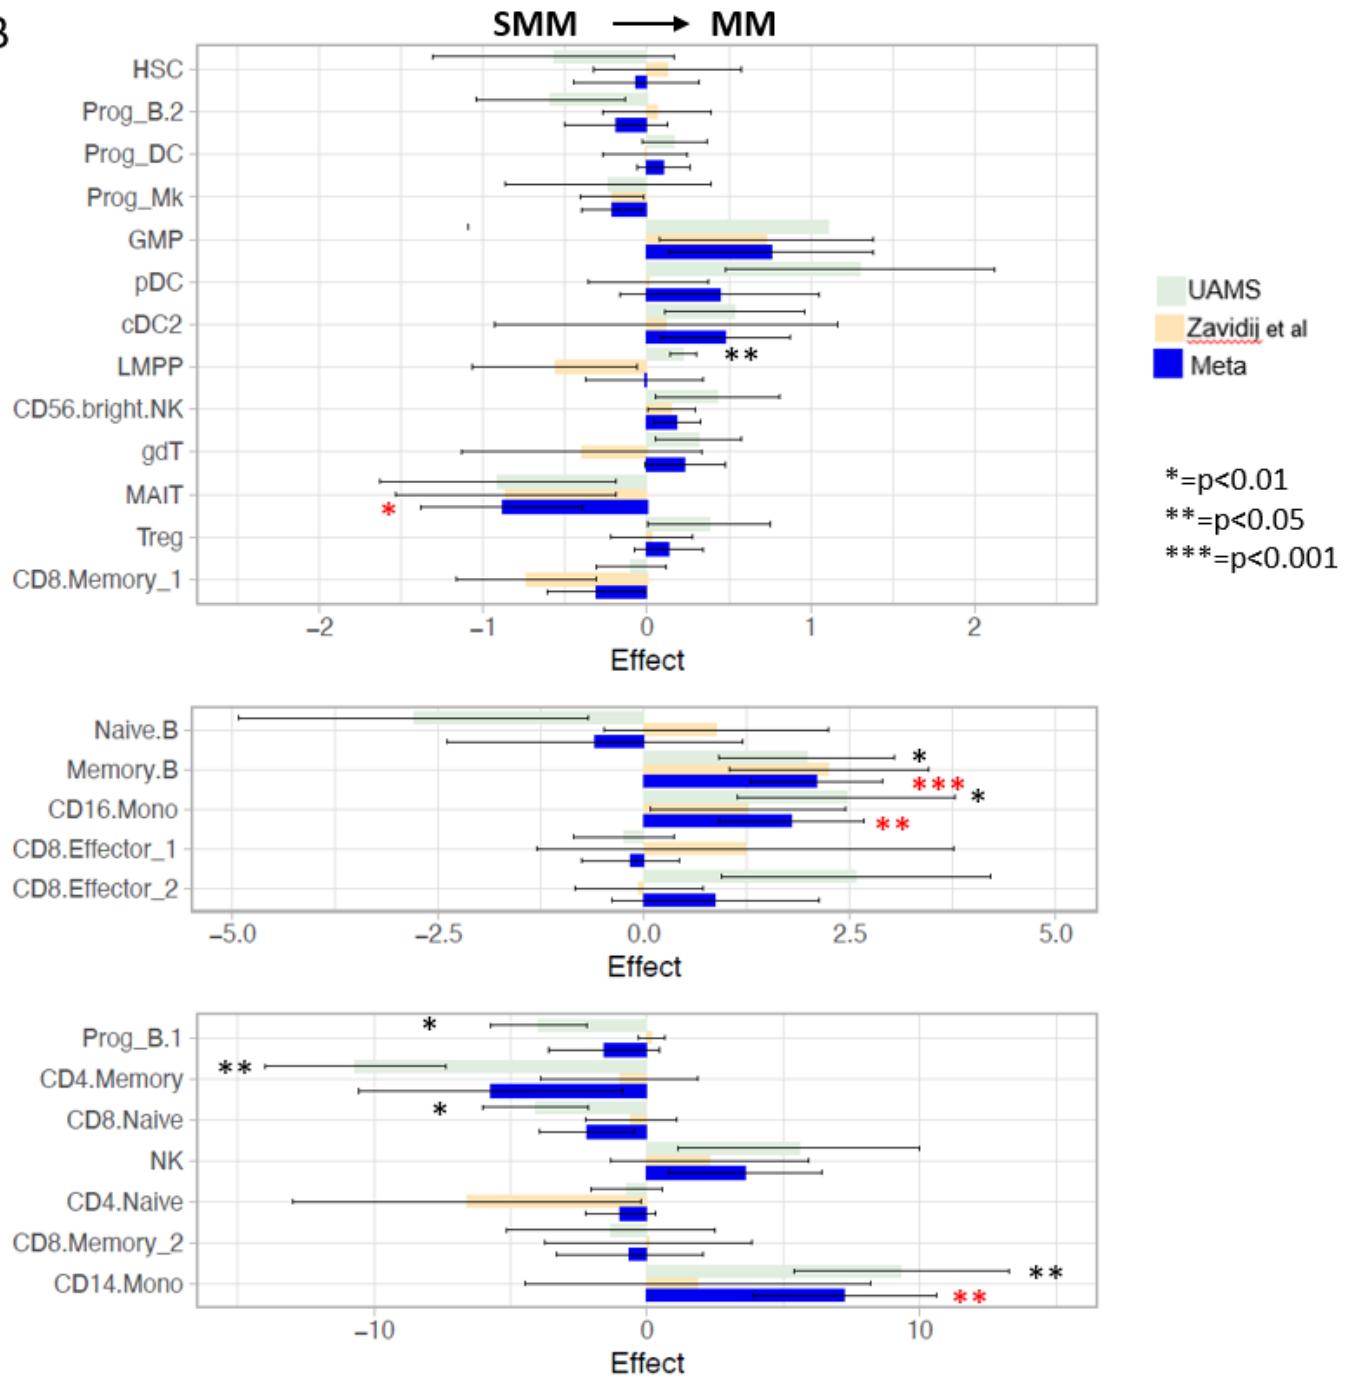

* = $p < 0.1$

** = $p < 0.05$

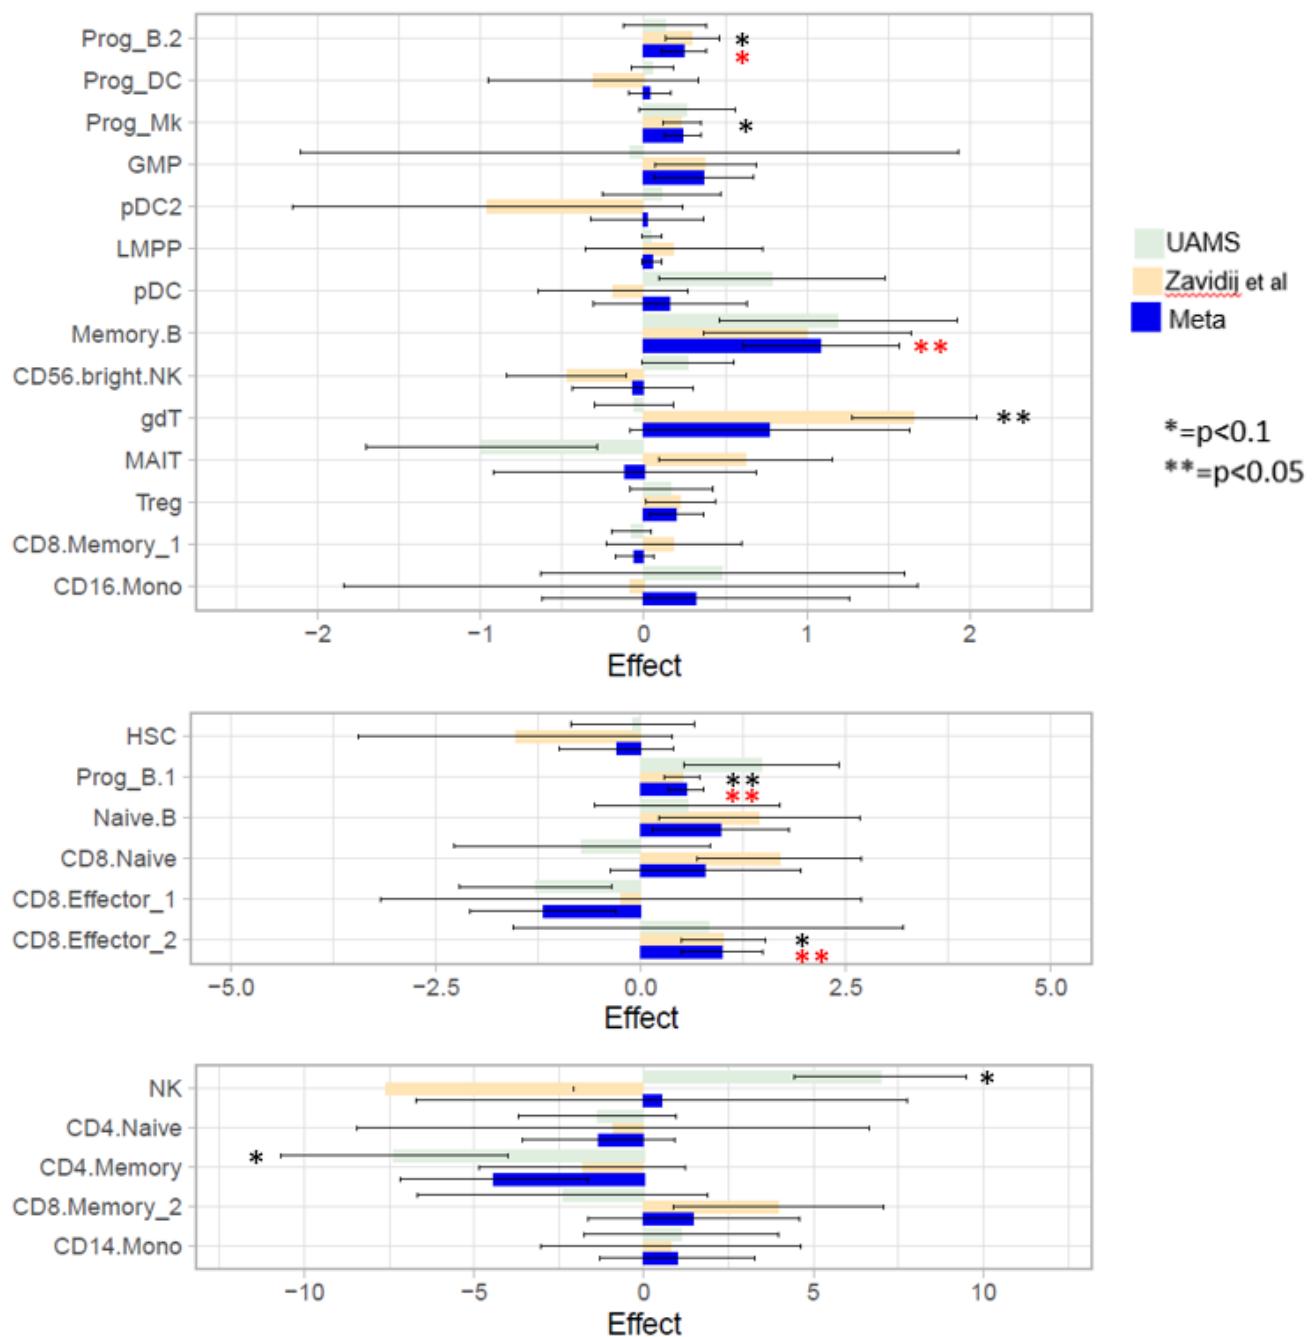

B

C

MGUS → SMM/MM

D

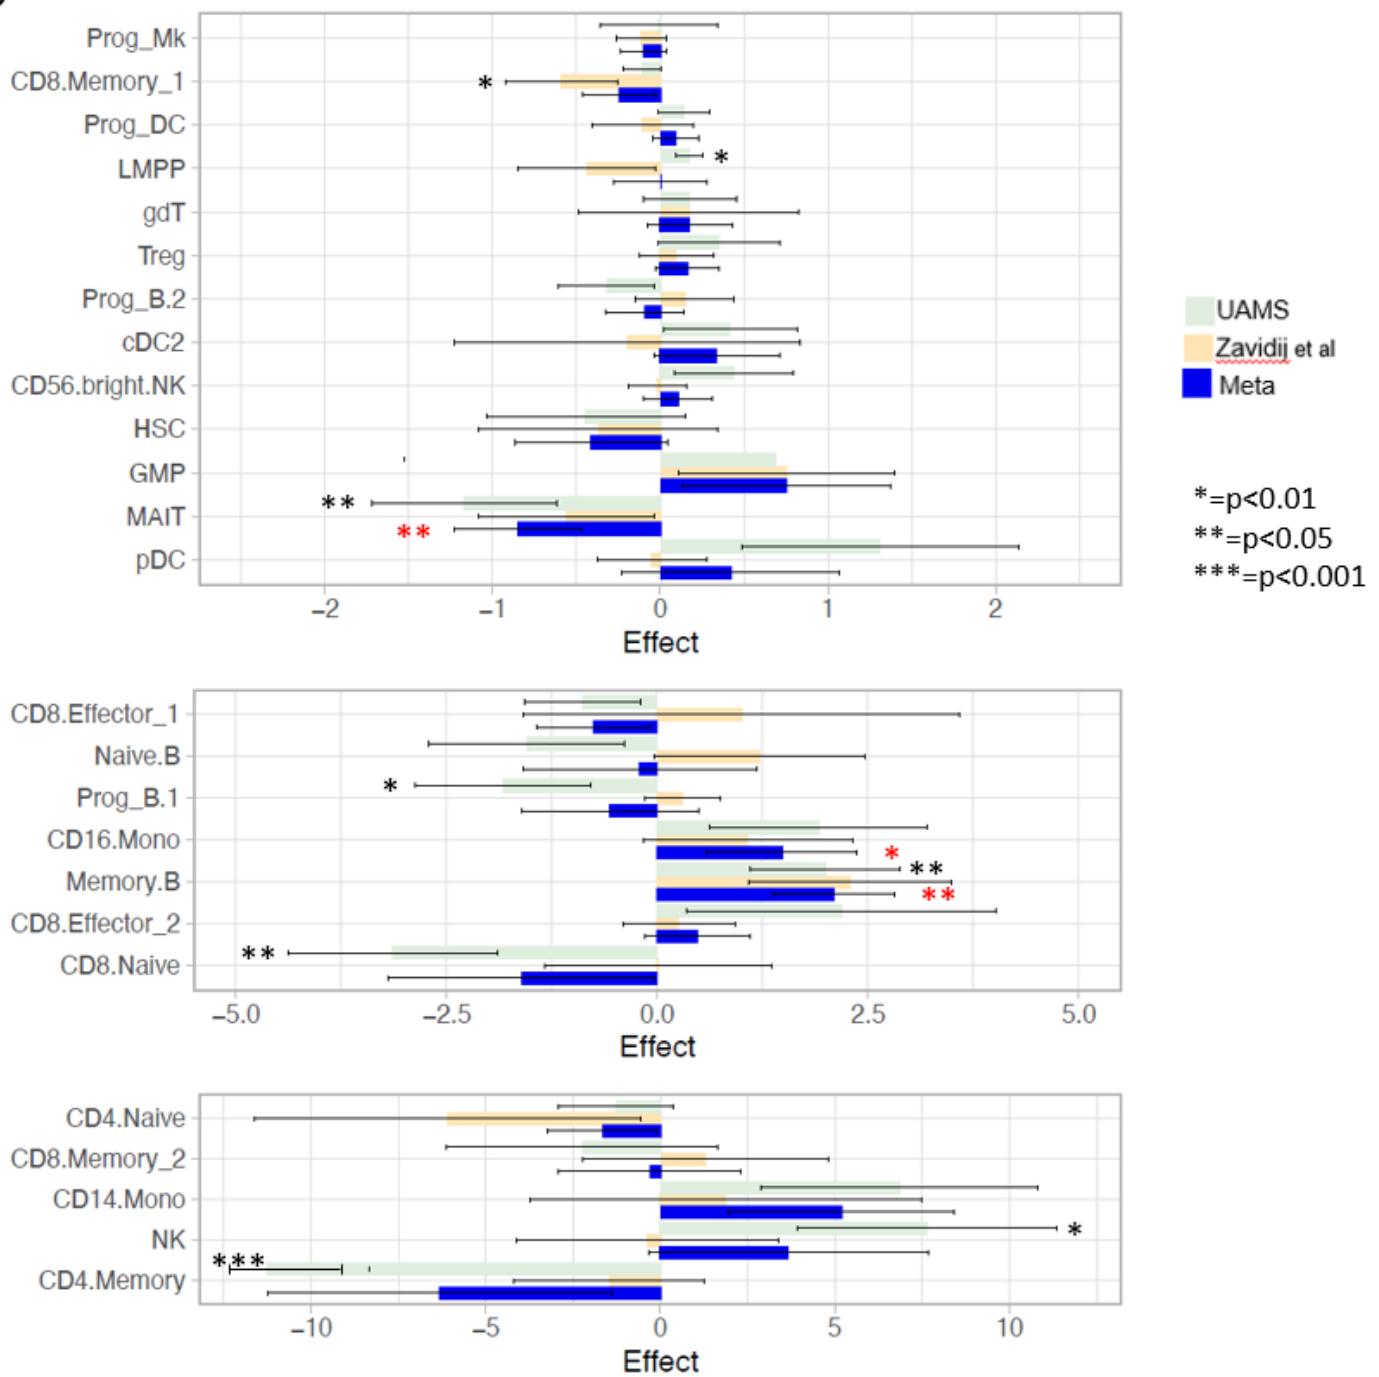

MGUS/SMM → MM

Figure 2. Heatmap of cell subset expression for each individual patient. Samples from the external dataset are annotated by disease stage_extern and followed by the ID from the original manuscript.

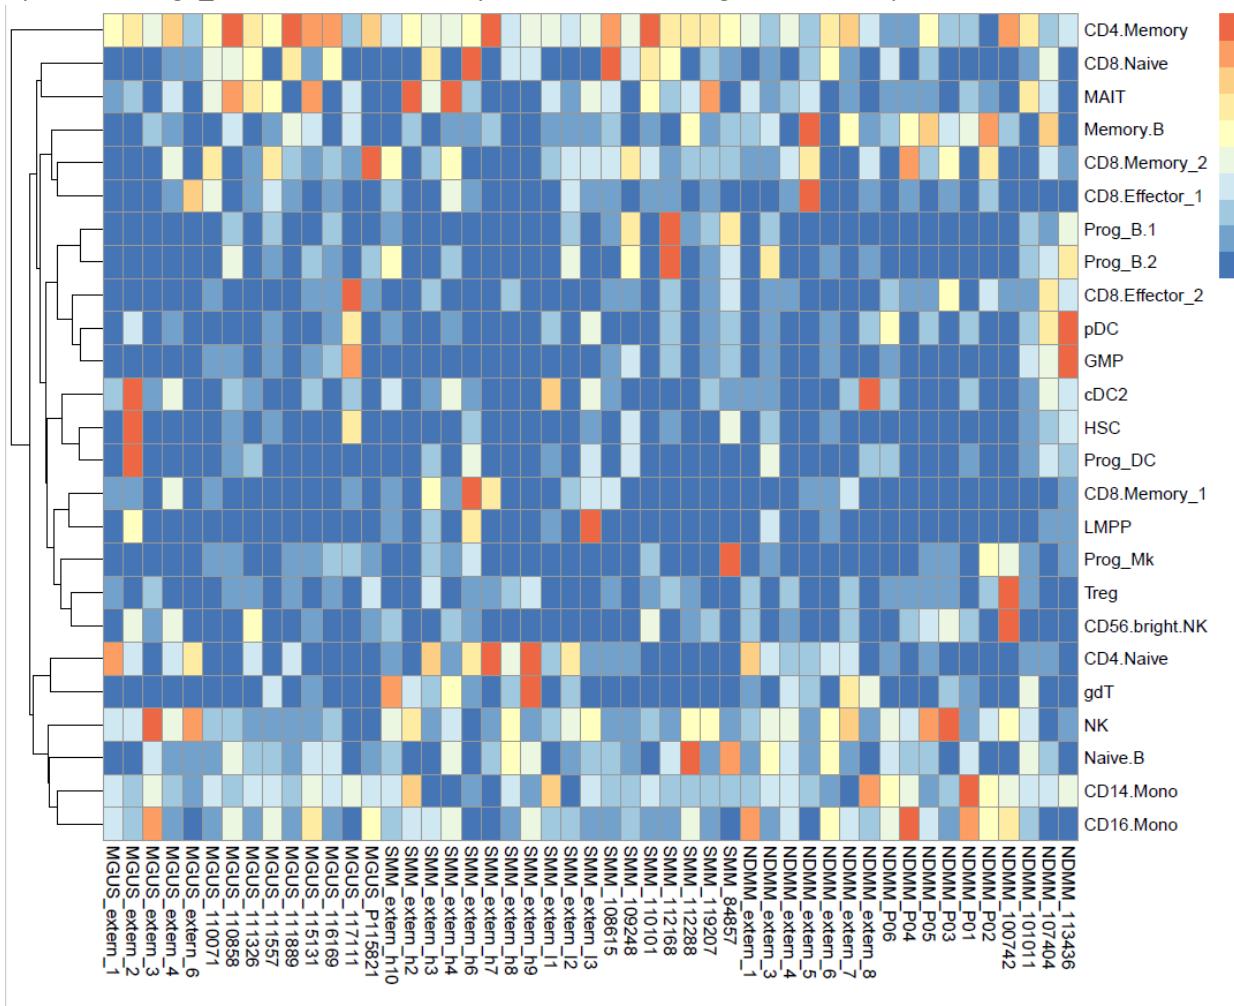

Figure 3. Proportion of B cells (A), T cells (B), CD56 NK cells (C) and monocytes in the BM aspirate by 8-color flow cytometry.

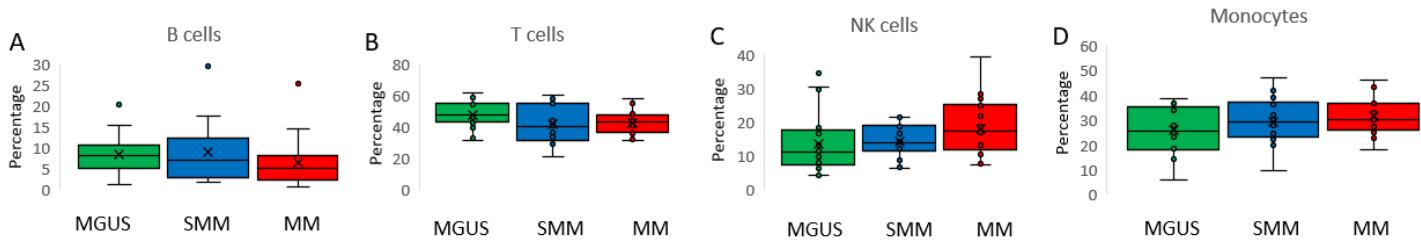

Figure 4. Proportion of CD4 T cells (A), CD8 T cells (B) and CD56 NK cells (C) in the peripheral blood by disease stage. Fig
