

**Supplementary Fig. S2. Relationships between pretreatment PD-L1 expression in primary patient samples and pathological responses associated with neoadjuvant chemoimmunotherapy.** Combined positive score (CPS) before treatment were plotted for patients with pathological complete response (pCR) (n=5), major pathological response (MPR) (n=9), and incomplete pathological response (IPR) (n=8). A, pCR vs IPR. B, MPR vs IPR. C, pCR + MPR vs IPR. *P*-values were determined using Mann–Whitney test.
