\*Indicates the non-significant variables that reduce the AIC value; Bolded rows indicated the selected models for describing risk indicators.

**Supplementary Figure 1.** Geographical distribution of parasites detected in dog (A) and cat (B) populations from 14 cities of East and South-East Asia.

**Supplementary Figure 2.** Pairwise association between potential risk factors and infection statuses. All variables were treated as categorical variables as: Species (dog and cat); Age (young: < 5 years, adult: 5 to 15 years, old: > 15 years); Sex (M: male, F: female); Neuter (Y: yes, N: no); Environment (RA: rural area, UA: urban area); Average annual temperature (low:  $\leq 24^{\circ}\text{C}$ , high:  $> 24^{\circ}\text{C}$ ); Annual precipitation (low:  $\leq 2000$  mm, high:  $> 2000$  mm); Population density (low:  $\leq 10000$  per  $\text{km}^2$ , > 10000 per  $\text{km}^2$ ); Pet-human ratio (low:  $\leq 0.05$ , high  $> 0.05$ ); Life expectancy (low:  $\leq 76$  years, high:  $> 76$  years). Infestation status for all parasites were denoted using 1 as infected and 0 as not infected. Colours represent the value of Cramér's V statistics with asterisks indicating the Cramér's V value greater than 0.3.
