Table S2: Estimates for vaccination coverage, proportion infected and mortality rates (per 100,000) under each vaccine sharing strategy and income group taken at the start of 2022. Bracketed values represent a 95% prediction interval, proportion vaccinated is deterministic and so an interval is not provided.

Table S3: Individual country level estimates for vaccination coverage, proportion infected and mortality rates (per 100,000) under each vaccine sharing strategy taken at the start of 2022. Bracketed values represent a 95% prediction interval, proportion vaccinated is deterministic and so an interval is not provided.

Table S4: Estimates for reductions in infection and mortality levels taken at the end of 2021 for central vaccine sharing strategies relative to the current scenario. Bracketed values represent a 95% prediction interval.

2 Lower level adapted behaviour

In tables S5 and S6 we present data for alternative simulations for scenarios with a lower level of adapted behaviour. As in the central adapted behaviour scenarios, we implement behavioural response by increasing/decreasing the control parameter for each country that is sharing vaccines, dependent on whether the number of active infections is increasing/decreasing (subject to a five day time lag to reflect delays in detection and reaction). However, in these alternative scenarios the control parameter is increased at 50% of the rate of the central scenarios.

3 Age biased sharing strategies

In tables S7 and S8 we present data for alternative strategies where vaccine redistribution is age biased, dependent on the number of unvaccinated individuals in each 5 year age bracket weighted by vulnerability (in the central scenarios vaccine redistribution is unweighted, proportional to the size of the eligible adult population of each country that is as yet unvaccinated).
