Supplementary Table 1. Demographic and clinical data of trauma patients.

Gender	Mechanism of injury	Injured body system	ISS Score	Hospitalization (days)	ICU length (days)	Requiring ICU treatment	Requiring mechanical ventilation
Male	Motor vehicle accident	Head/Brain, Lung/ Chest Wall	25	5	0.7	Yes	No
Male	Fall	Spine	6	3	1.4	Yes	Yes
Male	Fall	Abdominal	17	3	1.1	Yes	No
Male	Motor vehicle accident	Spine, Lung/ Chest Wall, Pelvis / Extremities Injury	17	5	0.7	Yes	Yes
Male	Motor vehicle accident	Lung/ Chest Wall, Pelvis / Extremities Injury	13	10	0	No	No
Male	Stab wound	Lung/ Chest Wall	10	5	0.38	Yes	No
Male	Gunshot wound	Pelvis / Extremities Injury	10	8	0	No	No
Male	Motor vehicle accident	Spine, Lung/ Chest Wall, Abdominal, Pelvis / Extremities Injury	24	23	13.8	Yes	Yes
Male	Motor vehicle accident	Head/Brain, Lung/ Chest Wall, Abdominal	22	7	1.79	Yes	Yes
Male	Fall	Head/Brain, Lung/ Chest Wall, Abdominal	21	10	3.39	Yes	Yes
Male	Motor vehicle accident	Head/Brain	75	3	1.69	Yes	Yes

Supplementary Table 2. Demographic and clinical data of control patients.

Gender	Hospitalization (days)	ICU length (days)	Requiring ICU treatment	Requiring mechanical ventilation
Male	4	0	No	Yes
Female	2	0	No	Yes
Female	6	1.3	Yes	Yes
Male	3	0	No	Yes
Female	8	0	No	Yes
Male	1	0	No	Yes
Male	8	0	No	Yes
Male	5	1.2	Yes	Yes
Male	2	0	No	Yes
Male	7	0	No	Yes

SUPPLEMENTARY MATERIALS

Supplementary Materials: Flow cytometry Antibodies.

Human studies: Anti-human CD8 APC/Cy7 (Clone SK1), anti-human CD39 FITC (Clone A1), anti-human CD73 APC (Clone AD2), anti-human CD279 (PD-1) Pacific Blue (Clone EH12.2H7), anti-human Tim-3 PE (Clone F38,2E2), anti-human CD152 (CTLA4) PE (Clone L3D10), anti-human CD45-RO PE/Cy7 (CloneUCHL1), anti-human Granzyme B APC (Clone QA16A02), anti-human IFN γ FITC (Clone 4S.B3), anti-human IL10 APC (Clone JES3-19F1), anti-human CD39-PE/Cy7 (Clone A1), anti-human CD73-PE (Clone AD2). All antibodies were from Biolegend, San Diego, CA); mouse studies: anti-mouse CD8a-APC/Cy7 (Clone: 53-6.7, Biolegend, San Diego, CA), anti-mouse CD39 PE/Cy7 (Clone 24DMS1, eBioscience, San Diego, CA), anti-mouse CD73-Pacific Blue (Clone TY/11.8, eBioscience, San Diego, CA), anti-mouse PD-1 PE (Clone 243, eBioscience, San Diego, CA), anti-mouse Tim-3 APC (Clone RMT3-23, Biolegend, San Diego, CA), anti-mouse CD152-BV605 (Clone UC10-4B9, Biolegend, San Diego, CA), anti-mouse CD44 APC (Clone IM7, eBioscience, San Diego, CA), anti-mouse IFN γ PE (Clone XM G1.2, eBioscience, San Diego, CA), anti-mouse IL10 APC (Clone JES5-16E3, Biolegend, San Diego, CA), anti-human/mouse Granzyme B PerCP-Cy5.5 (Clone QA16A02, Biolegend, San Diego, CA). LIVE/DEAD™ Fixable Violet Dead Cell Stain Kit for 405 nm excitation (Invitrogen™, Thermo Fisher Scientific).

Supplementary Figure 1: Representative flow cytometry gating strategy for blood-derived leukocytes in mice

(A) Lymphocytes are set in forward angle (FSC) versus right angle scatter (SSC). For selecting CD39⁺ and CD39⁻ cells histogram dot plots are used after gating for CD8⁺ cells. (B) Representative dot plots for CD39⁻CD73⁺, CD39⁺CD73⁺ and CD39⁺CD73⁻ cells are shown for control (untreated) and MT treated mouse. Additionally, unstained controls are displayed for CD39 and CD73 staining. (C) Representative dot plots for Tim-3⁺, PD-1⁺Tim-3⁺ and PD-1⁺ cells are shown for control and MT treated mouse. Additionally, unstained controls are displayed for PD-1 and Tim-3 staining (D-E) To analyze the frequency of Granzyme B⁺ cells and IL-10⁺ cells, CD8 expressing cells were set in a Granzyme B or IL-10 versus CD8 staining.

Supplementary Figure 2: Representative flow cytometry gating strategy for lung-derived leukocytes in mice

(A) Lymphocyte populations are selected in forward angle (FSC) versus right angle scatter (SSC). For identifying CD39⁺ and CD39⁻ cells histogram dot plots are used after gating for CD8⁺ cells. (B) Representative dot plots for CD39⁻CD73⁺, CD39⁺CD73⁺ and CD39⁺CD73⁻ cells and (C) for Tim-3⁺, PD-1⁺Tim-3⁺ and PD-1⁺ cells are shown for control (untreated) and MT treated mice. (D-E) The frequencies of Granzyme B⁺ CD8⁺ cells and IL-10⁺ CD8⁺ cells are displayed for control and MT treated mouse.

Supplementary Figure 3: Effect of intact whole mitochondria on CD8⁺ T cells *in vitro*.

(A) ROS production and ATP release from extracellular mitochondria isolated from mouse hepatocytes are visualized using fluorescent dye MitoSOXTM and ATP probe 2-2 Zn (×100 objective; scale bar, 10 μm) before and after addition of succinate (20 mM). (B-C) The phenotype of CD8⁺ T cells was assessed before and after addition of CD3/CD28 Dynabeads, in the absence (Control) or presence of adenosine (ADO) (50 μM), ATP (1mM) and mitochondria (MT) (50 μg/ml) for 24 hours. (B) Percentages of Granzyme B⁺ cells within CD8⁺CD39⁺ cells are shown. Mean± SEM frequency of IFN γ (C), Tim-3⁺ (D) and PD-1⁺ (E) within CD8⁺ cells are displayed. (F) Frequency of CTLA-4⁺ cells within blood derived CD8⁺ T cells in control (untreated) and MT treated mice is represented. P value calculated by Kruskal–Wallis tests followed by Dunn's multiple comparisons. * p < 0.05.

Supplementary Figure 4: Mitochondria and bacteria cause lung injury with loss of CD8⁺ T cells and accumulation of pro-inflammatory immune cells.

(A) Alveolar cells were obtained from mitochondria (MT, n=7), mitochondria and bacteria (MT+BAC, n=8) and bacteria (BAC, n=8) treated mice and stained for flow cytometry analysis. Mean± SEM frequency of CD11b⁺, Ly6G⁺, CD4⁺ and CD8⁺ cells within lung derived CD45⁺ cells are shown. (B-C) Representative images of immunohistochemical

staining of Ly6G neutrophils (B) and CD8 cells (C) in lung sections obtained from untreated (control) and MT, BAC and MT+BAC treated wild type mice ($\times 20$, scale bar: 100 μm). P value obtained using Kruskal–Wallis tests followed by Dunn’s multiple comparisons. ** $p < 0.01$.

Supplementary Figure 5: Mitochondria and bacteria induce Granzyme B⁺ and decrease IL-10⁺ production in lung derived CD39⁺ CD8⁺ T cell subsets.

Mice were untreated (controls, $n=4$), or treated with MT ($n=7$), MT+ BAC ($n=8$) and BAC ($n=8$). Lung derived CD8⁺ T cells obtained from these mice, were subdivided into CD39⁺ and CD39⁻ subpopulations. (A, B) Frequencies of Granzyme B⁺ cells are represented within lung derived CD39⁺CD8⁺ and CD39⁻CD8⁺ lymphocytes. (C, D) Percentage of IL10⁺ producing cells within CD39⁺CD8⁺ and CD39⁻CD8⁺ cells are shown. (E, F) Frequency of PD-1⁺Tim-3⁺ cells among CD39⁺CD8⁺ and CD39⁻CD8⁺ cells. Data represent mean \pm SEM. P value obtained using Kruskal–Wallis tests followed by Dunn’s multiple comparisons. * $p < 0.05$; ** $p < 0.01$.

Supplementary Figure 6: Characterization of CD8 T cell phenotype in trauma patients.

Frequencies of CD39⁻CD73⁺ (A) and CD39⁺CD73⁺ (B) within circulating CD8⁺ T cells in controls ($n=10$) and trauma patients ($n=10$ per group). (B) Circulating levels of mitochondrial DNA (fg/ μL) in controls and trauma patients at day 0/1 and day 2/3. Frequencies of PD-1⁺Tim-3⁺ cells within CD8⁺ cells (D) and CD39⁻CD8⁺ cells (E) in controls and trauma patients. Percentages of PD-1⁺Tim-3⁺ cells within CD39⁺CD8⁺ (F) and CD39⁻CD8⁺ lymphocytes (G) are shown. Frequencies of Granzyme B⁺ cells within CD39⁺CD8⁺ (H) and CD39⁻CD8⁺ lymphocytes (I) are displayed. Data represent mean \pm SEM. P value obtained using Kruskal–Wallis tests followed by Dunn’s multiple comparisons. ** $p < 0.01$.

Supplementary Video 1: MitoTracker™ staining following addition of CCCP, exogenous ATP and apyrase

Freshly isolated liver derived mitochondria were stained with MitoTracker™ and were imaged by video fluorescence microscopy. Uncoupling agent CCCP (10µM) was added after 10 sec. 100x oil objective, frame rate: 10 frame per 1 sec.

Supplementary Video 2: ATP Probe staining following addition of CCCP, exogenous ATP and apyrase

ATP release from freshly isolated liver derived mitochondria were imaged by using ATP probe 2-2 Zn and recorded by video microscopy following addition of 10µM CCCP (10 sec), exogenous 1mM ATP (50 sec) and 10 U/ml apyrase (70 sec). 100x oil objective, frame rate: 10 frame per 1 sec.

Supplementary Video 3: MitoSOX™ staining after addition of succinate

Liver derived mitochondria were visualized with MitoSOX™ and after addition of 20 mM succinate (11 sec). 100x oil objective, frame rate: 10 frame per 1 sec.

Supplementary Video 4: ATP Probe staining after addition of succinate

ATP release was monitored by video fluorescence microscopy following treatment with 20 mM succinate (12 sec). 100x oil objective, frame rate: 10 frame per 1 sec.
