Supplementary information

Material and Methods

Molecular cloning and protein expression

Full-length METTL3, METTL14, WTAP, and VIRMA were amplified from the *Homo sapiens* cDNA library. The truncated genes were subcloned using the standard polymerase chain reaction (PCR) method. All site-directed mutagenesis of WTAP and VIRMA was carried out using the Fusion PCR method.

For the cryo-EM sample preparation and the methyl transfer assay, the DNAs of human METTL3 and METTL14, WTAP (the WTAP[1-273] for cryo-EM sample preparation; the full-length WTAP for the methyl transfer assay), and VIRMA[381-1486] were subcloned into pFastBac dual. Both METTL14 and WTAP were expressed with an N-terminal His-tag. For the co-expression coupled purification assay, the genes WTAP and VIRMA were subcloned into a modified pFastBac1 vector, fused with a His-tag at the N-terminus. METTL3 and METTL14 were subcloned into pFastBac dual with a Strep-tag and His-tag at N-terminus, respectively. The baculoviruses were generated in Sf9 cells with the bac-to-bac system (Invitrogen). The proteins were co-expressed in Sf9 cells at 27 °C for 60 h before harvesting.

For the crystallization trials, the WTAP[130-241] was subcloned into pET21b (Novagen) and fused with a His-tag at the C-terminus. The plasmid was transformed into BL21 (DE3). One-liter lysogeny broth medium supplemented with 100 mg/mL ampicillin was inoculated with a transformed bacterial pre-

38 culture and shaken at 37 °C until the optical density at 600 nm reached 1.0. After being induced with

39 0.2 mM isopropyl-β-D-thiogalactoside (IPTG) and growing at 16 °C for 14 h before harvesting.

40

41 For the structure-guided mutagenesis analysis, Flag-tag WTAP[1-273] (plasmid 1) and His-tag VIRMA[381-

42 1486] (plasmid 2) were also subcloned into the pMlink vector with a C-terminal tag, respectively. The

43 Expi293F[TM] (Invitrogen) cells were cultured in SMM 293TI medium (Sino Biological Inc.) at 37 °C

44 under 5% CO_2 in a ZCZY-CS8 shaker (Shanghai Zhichu Instrument co., Ltd.) and diluted into 2.0×10^6

45 cells/mL for further transfection. For 30 mL cell culture, 30 μg plasmid 1 and 30 μg plasmid 2 were

46 pre-incubated with 180 μg linear polyethylenimines (PEIs) (Polysciences) in 2 mL fresh medium for

47 20 min. The transfection was initiated by adding the mixture to the diluted cell culture. Transfected cells

48 were cultured for 48 h before harvesting.

49

50 **Protein purification**

51 For the cryo-EM sample preparation and mRNA methyltransferase assay, the Sf9 cells were harvested

52 by centrifugation at $2000\times g$ for 15 min and homogenized in ice-cold lysis buffer (25 mM Tris-HCl, pH

53 8.0 and 150 mM NaCl) with 1 mM phenylmethanesulfonyl-fluoride (PMSF). The supernatants were

54 loaded onto Ni-NTA resin (Qiagen) and washed three times with lysis buffer containing 10 mM

55 imidazole. Elution was performed in Elution buffer (25 mM Tris-HCl, 250 mM Imidazole, pH 8.0 and

56 2 mM Dithiothreitol (DTT)), and applied to a Source Q10/100 column (GE Healthcare), followed by a

57 gradient NaCl elution (up to 1 M) in 25 mM Tris-HCl (pH 8.0). Target proteins were further purified

58 on a Superose 6 increase 10/300 GL column (GE Healthcare) equilibrated with SEC buffer (50 mM

59   HEPES, pH 7.5, 50 mM NaCl, and 50 µM MgCl$_2$).

60

61   To acquire the METTL3-METTL14-WTAP-VIRMA complex, METTL3-METTL14 protein and

62   WTAP-VIRMA protein were mixed at a molar ratio of 1:0.9 at 4 °C for 30 min. Then the mixture was

63   applied to Superose 6 increase 10/300 column equilibrated with SEC buffer. The METTL3-METTL14-

64   WTAP-VIRMA[381-1486] and the METTL3-METTL14-WTAP-VIRMA were used for the methyl transfer

65   assay. To prepare the sample for the cryo-EM, the peak fractions of METTL3-METTL14-WTAP[1-273]-

66   VIRMA[381-1486] were further treated by Gradient fixation (GraFix[1]). In detail, low buffer (SEC buffer

67   containing 10% v/v glycerol) was layered on top of an equal volume of freshly prepared high buffer

68   (SEC buffer containing 25% v/v glycerol and 0.05% glutaraldehyde) in a 12.5 mL tube before cooling

69   on ice. Centrifugation was performed at 33,000 rpm in a Beckman SW40Ti swinging bucket rotor for

70   18 h at 4 °C. GraFix peak fractions were collected by gradient fractionator (Biocomp), quenched with

71   100 mM Tris-HCl (pH 8.0), desalted (Hitrap desalting, GE Healthcare) into 25 mM imidazole, pH 8.0,

72   150 mM NaCl, 5 mM DTT and concentrated to 0.4 mg/mL.

73

74   For the crystallization trials, the bacterial pellet was collected and homogenized in a lysis buffer

75   containing 1 mM PMSF. After centrifugation at 14,000 rpm at 4 °C, the supernatant was loaded onto

76   Ni-NTA resin; washed three times with lysis buffer containing 15 mM imidazole, and eluted with

77   Elution buffer. The eluted protein was applied to a Source Q10/100 column. Target proteins were

78   subjected to a Superose 6 10/300 GL column (GE Healthcare), which was equilibrated with a buffer

79   containing 25 mM Tris-HCl, pH 8.0, 150 mM NaCl, and 5 mM DTT.

80   For the co-expression coupled purification assay and structure-guided mutagenesis analysis, the cells

81   were resuspended in 1 mL lysis buffer containing 1 mM PMSF, and lysed by repeated freeze-thaw using

82   liquid nitrogen. After ultracentrifugation, the supernatant was loaded onto a Strep-affinity or Flag-

83   affinity column, washed using lysis buffer, and eluted using a lysis buffer containing 3 mM

84   desthiobiotin, or 0.25 mg/mL Flag peptide (GenScript), respectively. The expression of WTAP and

85   VIRMA were verified by western blot.

86

87   **Crystallization**

88   The WTAP$^{130-241}$ protein was crystallized by using the hanging-drop vapor diffusion method at 18 °C,

89   and 1 μL of the sample was mixed with an equal volume of reservoir solution. Diamond-shaped crystals

90   appeared overnight from a reservoir solution containing 0.1 M MES (2-(N-morpholino) ethanesulfonic

91   acid), pH 6.0, 160 mM magnesium nitrate, 21 mM sodium bromide, 8% PEG6000 and 11% glycerol.

92   After 48 h of growth, the crystal ceased growing and was flash-frozen in liquid nitrogen. The

93   cryoprotection buffer including 20% v/v ethylene glycol and 10% w/v NDSB-201 added to the reservoir

94   solution. The WTAP$^{130-241}$ crystal diffracted beyond 2.40 Å at the Shanghai Synchrotron Radiation

95   Facility (SSRF) beamline BL17U1 (ref. 2).

96

97   **Crystal structure determination**

98   The dataset was collected at the SSRF beamline BL17U1 and processed with the HKL3000 (ref. 3).

99   Further processing was performed with the CCP4 suite[4]. Data collection and structural refinement

100   statistics are summarized in Table S1. The structure of the WTAP$^{130-241}$ was solved by molecular

101   replacement (MR) using the prediction structure from AlaphaFold2 (ref. 5) as the search models using

102   the program PHASER[6]. The structure was manually and iteratively refined with PHENIX[7] and COOT[8].

103   All figures representing structures were prepared with PyMOL.

104

105   **Sample preparation and cryo-EM data collection**

106   For cryo-EM data acquisition of the METTL3-METTL14-WTAP[1-273]-VIRMA[381-186] complex, right

107   before grid preparation the β-octyl glucoside was added to a final concentration of 0.05%, 3.5 μL

108   sample were deposited onto a freshly glow-discharged (Thermo Fisher, 20 mA, 120 s) holey carbon

109   grid (Quantifoil R1.2/1.3, Au 300 mesh) and plunged into liquid ethane using an FEI Virobot Mark IV

110   after blotting for 3.5 s with blot force 0, Whatman 597 filter paper at 4 °C and 100 % humidity. Each

111   grid was screened using a Thermo Scientific™ Glacios™ Cryo-EM at 200 keV. Cryo-EM data were

112   collected on a Titan Krios TEM operated at 300 keV and equipped with a K3 Summit direct detector

113   (Gatan) positioned to post a GIF quantum energy filter (slit width 20 eV). Automated data acquisition

114   was carried out using EPU in super-resolution mode at a magnified pixel size of 0.85 Å, with defocus

115   values ranging from -1.0 to -1.5 mm. The total exposure time was set to 2.51 s with 40 frames, resulting

116   in an accumulated dose of about 55.1 e$^-$ per Å^2.

117

118   **Cryo-EM data processing, model building and refinement**

119   The schematic of the data processing pipeline is shown in Fig. S4c. About 915,354 particles from 2040

120   micrographs were automatically picked using the cryoSPARC blob picker[9]. After two-dimensional

121   classification, a total of 890,453 good particles were selected and subjected to several cycles of three-

122   dimensional classification in cryoSPARC[9]. 197,685 particles belonging to the best class were selected;

123   this is followed by nonuniform refinement and local refinement. The METTL3-METTL14-WTAP-

124   VIRMA complex yielded a cryo-EM density with an estimated resolution of 3.10 Å based on gold

125   standard Fourier shell correlation[10].

126

127   The atomic model for the METTL3-METTL14-WTAP-VIRMA complex was built in COOT[11] and

128   refined with PHENIX[12]. The structure of the METTL3-METTL14-WTAP-VIRMA was validated

129   through the examination of Molprobity[13] scores and the Ramachandran plots (Table S2).

130

131   **RNA sample preparation and the methyl transfer assay**

132   The specific RNA (5′-UACACUCGAUCU<u>GGACU</u>AAAGCUGCUC-3′)[14], and the nonspecific RNA

133   (5′- UACACUCGAUCU<u>UUUUU</u>AAAGCUGCUC-3′, as negative control) were used in the methyl

134   transfer assay. RNA samples were synthesized using the ABI-3400 Synthesizer with phosphoramidites

135   as previously described[15].

136

137   Reactions were carried out in duplicates with a 10 μL reaction mixture containing [ssRNA]=1 oligos,

138   [SAM]=1 μM, [E]=1 μM in SEC buffer at 25 °C for 20 min. Reactions were terminated by the addition

139   of trifluoroacetic acid (TFA) to a final concentration of 0.1% (v/v) and an 8-μL mixture was transferred

140   to a Half-Area 384-well plate. The activity was measured using an MTase-Glo™ Methyltransferase

141   Assay kit in which the reaction by-product SAH is converted into ATP in a two-step reaction and ATP

142   can be detected through a luciferase reaction[16]. The luminescence signal was measured by a TECAN

143   infinite M200 (TECAN).

144

145   *In vitro* **cross-linking**

146   The cross-linking agent bis(sulfosuccinimidyl) suberate (BS3, from Thermo Fisher) was prepared at a

147   concentration of 100 mM in DMSO. BS3 was added to the quaternary protein complex (4.8 µM) to a

148   final concentration of 1.67 mM. The reaction was performed at 30 ºC for 30 min and then quenched by

149   the addition of 20 mM Tris-HCl (pH 7.5). The experiments were triplicated with three parallel samples.

150

151   **Mass spectrometry and data analysis.**

152   The cross-linked protein sample was precipitated with 6 volume pre-chilled acetone at 4 °C and

153   centrifuged for 20 min to remove supernatant. The precipitate sample was dissolved in 8 M urea and

154   0.1 M Tris-HCl (pH 8.5), reduced with 5 mM DTT at 25 °C for 10 min, and alkylated with 10 mM

155   iodoacetamide in dark for 15 min. Subsequently, 3 volumes of Tris-HCl (pH 8.5) were added to dilute

156   the sample, which also contained 1 mM $CaCl_2$ (to repress Chymotrypsin activity) and 20 mM

157   methylamine (to reduce the modification of the Carbamate modification at the N-terminus of the peptide

158   segment). Trypsin digestion was carried out at 37 °C overnight with sequencing grade modified trypsin

159   (Promega, mass ratio = 1:20). The reaction was quenched with trifluoroacetic acid to a final

160   concentration of 5%.

161

162   Trypsin-digested peptides were purified with C18 Spin Tips (Thermo Fisher Scientific) and were

163   analyzed in the Orbitrap Fusion Lumos mass spectrometer (Thermo Fisher Scientific) coupled to an

164   EASY-nLC 1200 liquid chromatography system, with a 75 μm, 2 cm Acclaim PepMapTM 100 column.

165   The peptides were eluted over a 65 min linear gradient from 95% buffer A (water with 0.1% Formic

166   acid) to 35% buffer B (acetonitrile with 0.1% Formic acid) with a flow rate of 200 nL/min. Each full

167   MS scan (Resolution = 70,000) was followed by 15 data-dependent MS2 (Resolution = 17,000), with

168   HCD (higher-energy-collisional-dissociation) and an isolation window of 1.6 m/z. The normalized

169   collision energy was set to 30. Precursors of charge state ≤ 3 were collected for MS2 scans in the

170   enumerative mode; precursors of charge state 3–6 were collected for MS2 scans in cross-link discovery

171   mode. Monoisotopic precursor selection was enabled, and a dynamic exclusion window was set to 30

172   s.

173

174   The cross-linking data were analyzed by pLink2 (ref. 17). The following search parameters were used:

175   MS1 accuracy of ±20 ppm; MS2 accuracy = ±20 ppm; enzyme = trypsin (with full tryptic specificity

176   but allowing up to three missed cleavages); crosslinker = BS3 (with an assumed reaction specificity for

177   lysine and protein N termini); fixed modifications = carbamidomethylation on cysteine; variable

178   modifications = oxidation on methionine, hydrolyzed/aminolyzed BS3 from reaction with ammonia or

179   water on a free cross-linker end. The identified candidates have filtered these parameters: false

180   discovery rate (FDR) < 5%, supervised vector machine or SVM score < 10^{-2}, and abundance or peptide-

181   spectrum matches (PSMs) ≥ 3. The experimental cross-links were illustrated with Crosslink-viewer[18].

182   Only cross-links that were observed in at least two biological repeat experiments were used for

183   structural modeling of the quaternary complex.

184

AI-based structure prediction

Each experimental cross-link was converted to distance restraints. They were applied to the Cα atoms of the cross-linked residues with an upper distance bound of 26 Å (a 2-Å padding was added to account for local flexibility[19]). However, due to the limited reactivity of BS3, multiple binding modes between proteins have to be invoked to account for the intermolecular cross-linking data[20, 21]. On the other hand, due to the sparsity of the restraints, each binding mode cannot be effectively validated.
We used AlaphaFold2 (version 2.2) multimer[5] to build the structural models of the complex. To narrow the search space, only the structural models of binary complexes were predicted. Prediction of the binary complex was further sped up by including only the N terminal domains of METTL3 (with WTAP) and METTL14 (with VIRMA), to which the majority of the intermolecular cross-links were identified. On the other hand, VIRMA residues D342-D1292 and WTAP residues T148-D237 were included in AlaphaFold2 multimer prediction. The initial model of the quaternary complex was further constructed with the incorporation of the known binary complex structures of METTL3-METTL14 catalytic domain and METTL3 ZFD[15, 22] and VIRMA-WTAP (this study).

The position of the METTL3-METTL14 catalytic domain was further optimized by incorporating the cross-link restraints to residue K398 near the C-terminus of METTL14. Since AlphaFold2 gave a low-confidence prediction to the flexible linker residues[23], database potential[24] and a weak radius of gyration potential[25] were further incorporated for conformation optimization and packing against the structured portions.

274 Inter-subunit crosslinks MTC, METTL3, METTL14, WTAP and VIRMA[381-1486]. The numbers of the

275 corresponding spectra of each cross-link were indicated by the color of the line. Cross-links were

276 filtered by requiring FDR < 0.05 at the spectra level, SVM-value $< 1 \times 10^{-2}$ and spectral counts $\geq$ 3. **b**

277 The inter-subunit BS3-crosslinked residue pairs. Residues in METTL3, METTL14, WTAP[A], WTAP[B]

278 and VIRMA involved in the crosslinked pairs are shown in magenta, chartreuse, cyan, yellow and light

279 blue rectangles, respectively.

280

281 **Table S1** Statistics of crystal data collection and refinement of the human WTAP.
282

	WTAP[130-241] PDB: 7YFJ
Space group	$P6_122$
Cell dimensions	
a, b, c (Å)	62.75, 62.75, 336.35
α, β, g (°)	90, 90, 120
Number of molecules in ASU	2
Wavelength (Å)	0.97915
Resolution (Å)	45~2.40(2.49~2.40)
Rmerge (%)	9.9(97.8)
Rpim (%)	3.1(30.0)
I/σ I σ	18.8(2.4)
Completeness (%)	99.5(99.6)
Number of measured reflections	331,188
Number of unique reflections	16,547
Redundancy	20.0(20.7)
Wilson B factor (Å^2)	55.66
R_{work}/R_{free} (%)	21.95/23.98
Number of atoms	1656
Protein	1558
Main chain	756
Side chain	802
Water	84
Other entities	14
Average B value (Å^2)	65.2
Protein	65.3
main chain	87.7
side chain	80.6
Water	86.4
Other entities	132.6
R.m.s. deviations	
Bond lengths (Å)	0.008
Bond angle (°)	0.925
Ramachandran plot statistics (%)	
Most favorable	98.3
Allowed	1.7
Disallowed	0

283   **Table S2** Statistics of cryo-EM data collection and refinement of the METTL3-METTL14-WTAP-
284   VIRMA complex.
285

	METTL3-METTL14-WTAP$^{1\text{-}273}$-VIRMA$^{381\text{-}1486}$ PDB: 7YG4 EMBD: EMD-33807
Data collection and processing	
Microscope	Krios
Voltage (kV)	300
Camera	Gatan K3
Magnification	105,000
Pixel size at detector (Å/pixel)	0.85
Total electron exposure (e$^-$/Å^2)	55.1
Frames collected during exposure (no.)	40
Defocus range (μm)	-1.0~-1.5
Automation software	EPU
Micrographs collected (no.)	2,040
Micrographs used (no.)	2,027
Total extract particles (no.)	915,354
For each reconstruction	
Refined particles (no.)	197,685
Final particles (no.)	197,685
Point group	C1
Resolution (global, Å)	
FSC 0.5 (unmasked/masked)	5.9/3.6
FSC 0.143 (unmasked/masked)	3.7/3.0
Resolution range (local, Å)	
Map sharpening B factor (Å^2)	96.7
Map sharpening methods	Half-maps correlation
Model composition	
Protein	953
Ligands/DNA/RNA	0
Model refinement	
Refinement package	PHENIX

- real or reciprocal space	Real Space
- resolution cutoff	3.1
Model-Map scores	
- CC	0.85
B factors (Å^2)	
Protein residues	75.34
Ligands/DNA/RNA	0
R.m.s. deviations from ideal values	
Bonds length (Å)	0.003
Bond angles (°)	0.584
Validation	
MolProbity score	1.60
CaBLAM outliers	1.64
Clashscore	7.09
Poor rotamers (%)	0
C-beta deviations	0
EMRinger score (if better than 4 Å resolution)	1.84
Ramachandran Plot	
Favored (%)	96.68
Outliers (%)	0
