

## Supplemental Material

Supplemental Methods

Supplemental Tables

Supplemental Table 1: Genotype-phenotype correlation in males with digenic Alport syndrome including a *COL4A5* variant

Supplemental Table 2: Genotype-phenotype correlation in females with digenic Alport syndrome including a *COL4A5* variant

Supplemental Table 3: Genotype-phenotype correlation in males and females with digenic Alport syndrome with a *COL4A3* and *COL4A4* variant

## Supplemental Methods

Individuals provided informed consent to the use of their deidentified clinical data at the time of testing or their data in publications or databases were considered to be in the public domain.

Kaplan-Meier plots of kidney survival were constructed as follows.

Males with X-linked Alport syndrome and a pathogenic *COL4A5* variant were identified from LOVD (<https://databases.lovd.nl/shared/genes/COL4A5>) and age at kidney failure extracted. Age at kidney failure was the age at the diagnosis of kidney failure, or where this was not available, the commencement of dialysis, or at first kidney transplant. Affected male family members were included separately. Where only median or mean age at kidney failure was reported for a family, this was used instead. Where a male had not yet progressed to kidney failure, his age at most recent examination was included as a censored data point. Kidney survival curves were compared using the log-rank test.

Survival analysis was performed in R (version 3.6.2) using the *survival* and *survminer* packages <sup>1,2,3</sup>.
