Supplemental Table 2. Donor cohort vaccinated with Dryvax.

	Healthcare workers			
	<i>Unexposed (n=15)</i>	<i>non-vaccinated (n=21)</i>	<i>2 weeks post vaccination (n=19)</i>	<i>5-7 months post vaccination (n=18)</i>
Age (years)	18-26 [Median =23, IQR = 22]	23-55 [Median =34, IQR = 27]	18-62 [Median =29, IQR = 25]	23-62 [Median =43, IQR = 34]
Gender				
Male (%)	53% (8/15)	48% (10/21)	53% (10/19)	33% (6/18)
Female (%)	47% (7/15)	52% (11/21)	47% (9/19)	67% (12/18)
Days post vaccination	N/A	N/A	13-22 [Median =14, IQR = 14]	141-217 [Median =172, IQR = 142]
Sample collection date	Jun 2019- Dec 2021	Jun 2003-Oct 2005	Jul 2003-Sep 2007	Jun 2003-Aug 2007

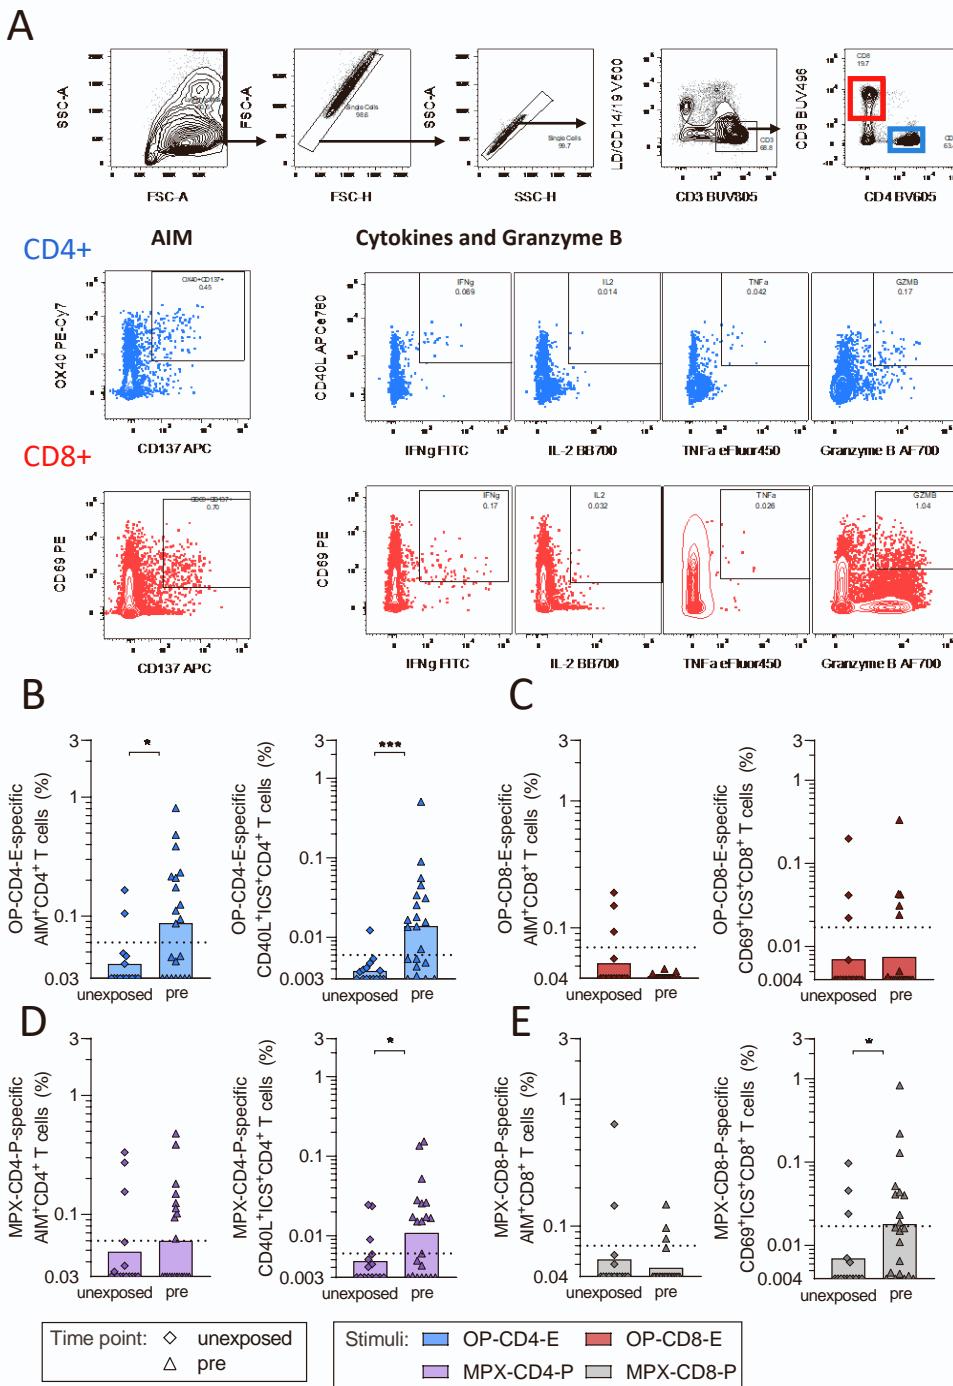

Figure S1. Gating strategy for AIM+ICS assay and T cell reactivity in unexposed and pre-vaccinated individuals.

Related to Figures 1 and 3. (A) Gating strategy for the AIM/ICS assays used in the study. The indicated AIM or intracellular markers were used to assess OPXV or MPXV specific T cell reactivity. For ICS, the total reactivity was calculated from cells positive for IFN γ , IL-2, TNF α or GZMB in combination with CD40L for CD4+ or CD69 for CD8+, with the exception of single positive GZMB cells which were excluded from the CD8 sum. Unexposed individuals (n=15, diamond) and pre-vaccinated healthcare workers (n=21, triangle) were tested in AIM+ICS assays for (B) CD4+ and (C) CD8+ T cell reactivity to the OPXV megapools, OP-CD4-E (blue) and OP-CD8-E (red). The same donors were tested for (D) CD4+ and (E) CD8+ T cell reactivity for MPXV predicted peptide pools, MPX-CD4-P (purple) and MPX-CD8-P (grey) respectively. The Y axis of each bar graph starts at the LOD and the LOS is indicated with a dotted line. Mann-Whitney T test was applied to each graph and p values symbols are shown when significant. * p<0.05, ***p<0.001.

Supplemental Table 3. Summary of immunodominant MPXV proteins based on IEDB epitope orthologs and predicted MPXV T cell epitopes. This summary is based on epitope reassignment to MPXV orthologs and therefore encompasses differences based on different nomenclatures for the various OPXV species listed in Supplemental Table 1.

Cell type	Acc. no.	VACWR antigen	transcription classification ^a	Function ^b	Protein name	Len (OP X)	IEDB epitopes	MPx antigen	MPX protein name	Len (MP X)	# of predicted epitopes	Megapool

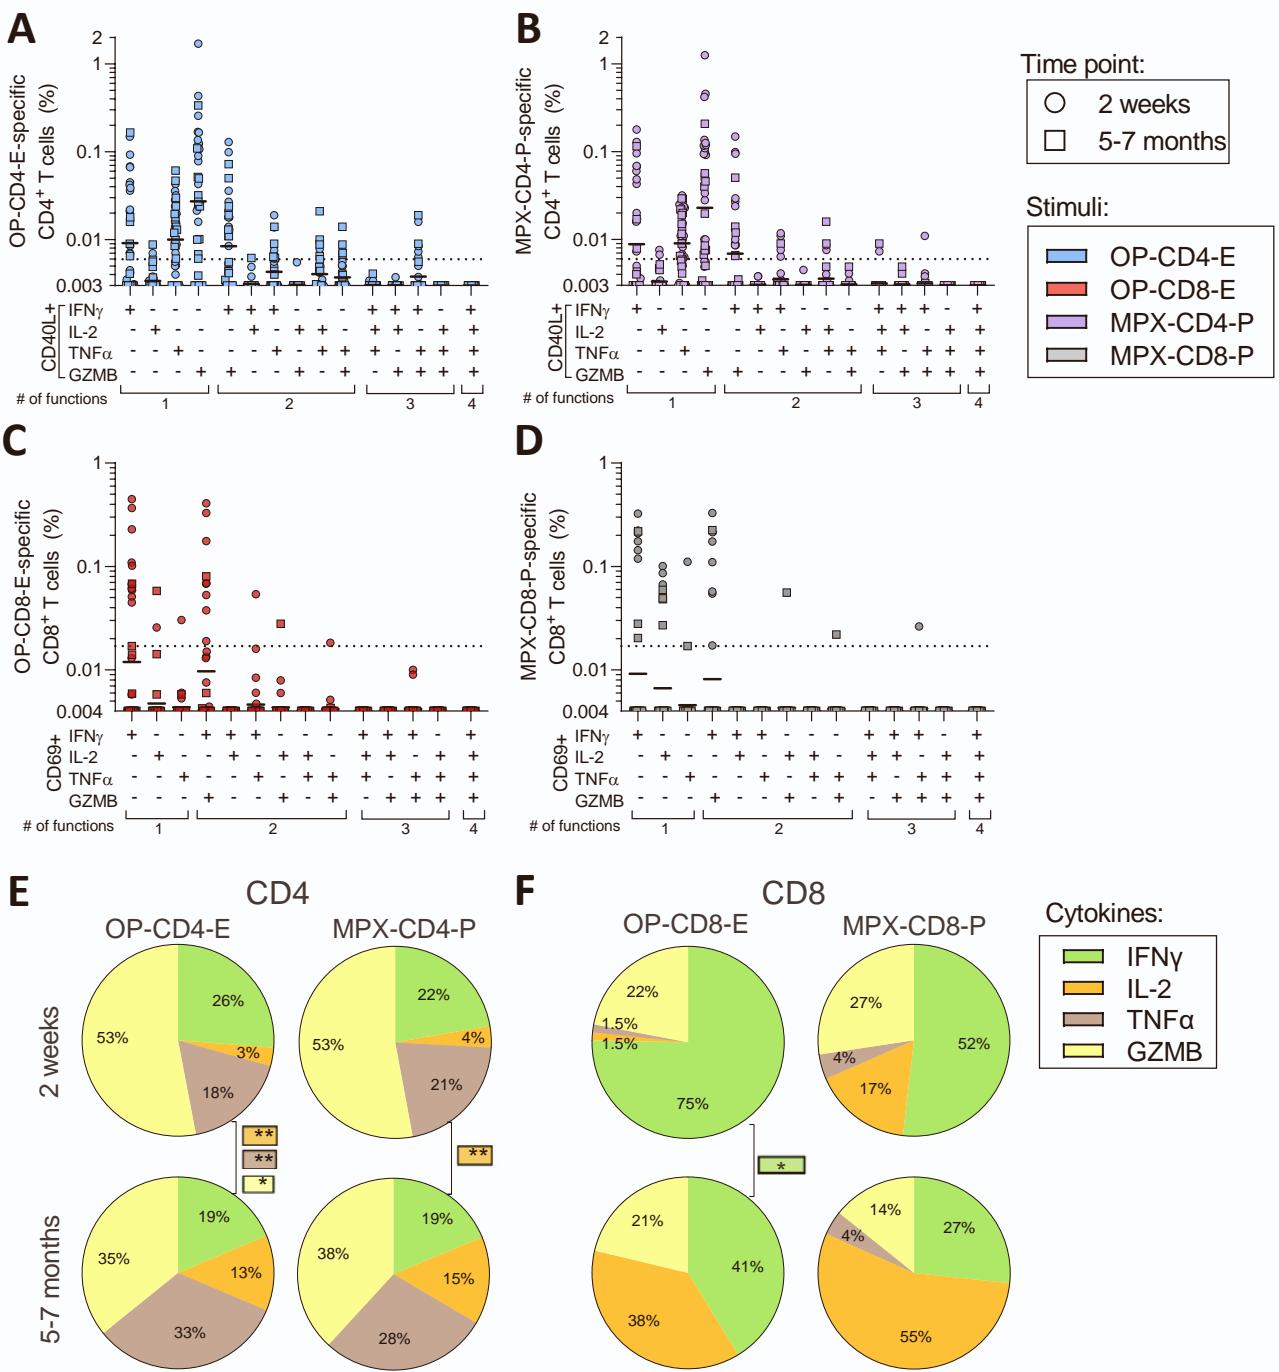

Figure S2. Quality of OPXV and MPXV-specific- T cell responses.

Related to Figures 1 and 3. PBMCs were collected from donors two weeks after vaccination with Dryvax ($n=19$, circle) and five to seven months after vaccination ($n=18$, squares) and tested in AIM+ICS assays for T cell reactivity to OPXV and MPXV. (A – B) Boolean gating of (A) OP-CD4-E- or (B) MPX-CD4-P-specific CD4+ ICS reactivity is shown for CD40L⁺ CD4⁺ T cells in combination with IFN γ , IL-2, TNF α and GZMB. (C - D) Boolean gating of (C) OP-CD8-E- or (D) MPX-CD8-P-specific CD8 ICS reactivity is shown for CD69⁺ CD8 T cells in combination with IFN γ , IL-2, TNF α or GZMB. The Y axis of each bar graph starts at the LOD and the LOS is indicated with a dotted line. Contribution of IFN γ , IL-2, TNF α and GZMB to the total of (E) CD4 or (F) CD8+ ICS responses to OP and MPX megapools at two weeks and 5-7 months post vaccination. Mann-Whitney T test was applied to each pie chart and p values symbols are shown when significant. * $p<0.05$, ** $p<0.01$.
