22 **eText. Supplementary Methods**

23 **Study population and severity classification**

24 Convalescents in this study refer to patients who were admitted to the hospital and discharged
25 after recovery. Detailed inpatient information of the participants was shown in Supplementary
26 eTable 5. COVID-19 cases were diagnosed according to the 7th Trial Version of national
27 guidelines released on March 3, 2020 (2020). Critical patients were defined as having acute
28 respiratory distress syndrome and in the need of mechanical ventilation, and/or shock, and/or
29 having complications of other organ failures. Severe patients were defined as respiratory rate
30 ≥ 30 /min, and/or oxygen saturation levels (SpO_2) at rest $\leq 93\%$, and/or arterial partial pressure
31 of oxygen (PaO_2)/fraction of inspired oxygen (FiO_2) ≤ 300 mmHg, and/or pulmonary lesion
32 progression $>50\%$ within 24 to 48 hours. Moderate patients were defined as having fever and
33 respiratory symptoms and radiological findings of pneumonia. Mild patients were defined as
34 having mild clinical symptoms with no sign of pneumonia on imaging. Given the limited
35 number of mild and critical patients in this study, we defined mild participants as those who
36 met either moderate or mild patients' standards and severe participants as those who met either
37 critical or severe patients' standards.

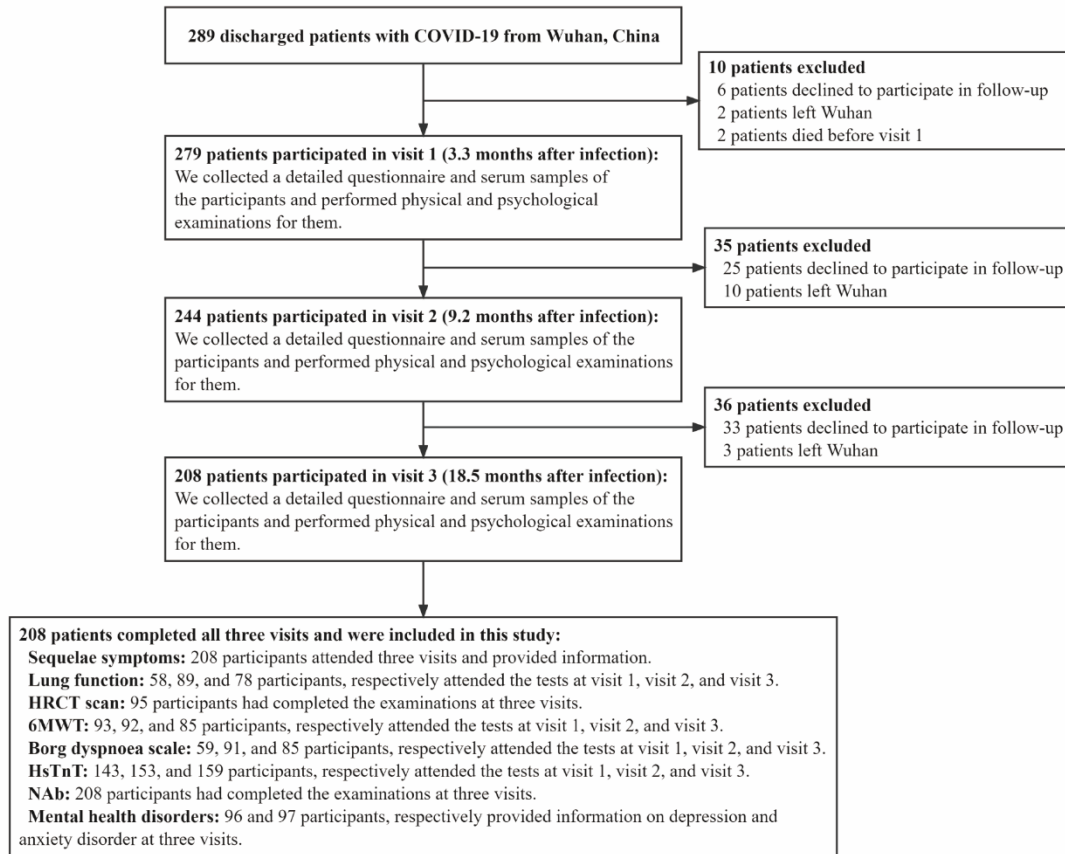

38 **Admission and discharge criteria**

39 Patients were confirmed and admitted to the hospital if they were positive for the real-time
40 fluorescent (RT-PCR) test of COVID-19, and/or had highly homologous viral gene sequence
41 to COVID-19, and/or were detected serum COVID-19 specific IgM and IgG (IgG is detectable
42 or reaches 4-fold titration increase in convalescence compared with the acute phase) (2020).
43 The patients could be discharged only if all the following criteria were met: normal body
44 temperature for more than 3 days; obvious improved respiratory symptoms; obvious absorption
45 of inflammation in pulmonary imaging; twice consecutive and negative nuclei acid tests on
46 respiratory tract samples, with sampling interval no less than 24 hours (2020). The

47 hospitalization duration was defined as the interval between discharged date and the confirmed
48 date.

49 **Statistical analysis**

50 Continuous variables were expressed as median (interquartile range) and compared by using
51 the Mann-Whitney U test or Kruskal-Wallis test according to nonnormal distribution assessed
52 by Shapiro-Wilk tests. Categorical variables were expressed as frequency (percentage) and
53 compared with χ^2 test or Fisher's Exact test in group comparisons. Linear mixed model was
54 established to calculate the fixed effects of repeated measures on log-transformed NT₅₀ for
55 serum SARS-CoV-2 NAb, adjusted for age (continuous), gender (male or female), and
56 vaccination (vaccinated group or unvaccinated group). Random effects included days of the
57 NAb test after symptom onset and days of the first shot of the COVID-19 vaccine since
58 symptom onset of each participant. Generalized linear mixed models were established to
59 explore the associations of any sequelae symptoms (categorical) with fixed effects. Each
60 participant was included in random effect. For the age group (<60 years/ \geq 60 years), we
61 adjusted gender (male/female) and education (middle school or lower/college or higher).
62 Comorbidities including hypertension (no/yes), diabetes (no/yes), and CVD (no/yes), and
63 disease severity (mild/severe) were excluded due to the potential mediating effects. For gender,
64 we adjusted age group, education, comorbidities, and disease severity. For education, we
65 adjusted age group, gender, and disease severity. Comorbidities were excluded due to the
66 potential mediating effects. For comorbidities (hypertension, diabetes, and CVD), we adjusted
67 each for age group, gender, education, and comorbidities except itself. Disease severity
68 (mild/severe) was excluded due to the potential mediating effects. Two-sided *P* values less than
69 0.05 were considered statistically significant. All data analyses were performed using R
70 statistical software version 4.1.0 (The R Foundation for Statistical Computing).

71

72 **eFigure 1. Flow chart of the study.**

73 **Figure Legend:** The profile of the study.

74 HRCT, high-resolution chest CT; 6MWT, 6-minute walking test; hsTnT, highly-sensitive

75 troponin T; NAb, neutralizing antibody.

eTable 1. Basic characteristics of convalescents according to disease severity.

Variables	Mild (N=146)	Severe (N=62)	P value
Age, years	58 (50, 64)	57 (50.3, 64.8)	0.862
Gender, n (%)			0.806
Male	71 (48.6)	29 (46.8)	
Female	75 (51.4)	33 (53.2)	
Education, n (%)			0.378
Middle school or lower	101 (69.2)	39 (62.9)	
College or higher	45 (30.8)	23 (37.1)	
Household income, n (%)			0.238
< 50000 RMB/year	79 (54.1)	28 (45.2)	
≥ 50000 RMB/year	67 (45.9)	34 (54.8)	
Cigarette smoking, n (%)			0.253
Never-smoker	126 (86.3)	57 (91.9)	
Ever-smoker	20 (13.7)	5 (8.1)	
Alcohol consumption, n (%)			0.499
Never-drinker	127 (87.0)	56 (90.3)	
Ever-drinker	19 (13.0)	6 (9.7)	
Comorbidity, n (%)			
Hypertension	58 (39.7)	17 (27.4)	0.091
Diabetes	16 (11.0)	7 (11.3)	0.944
CVD	10 (6.8)	4 (6.5)	1.000
Body mass index	24.6 (22.9, 27.0)	23.4 (22.0, 25.5)	0.010
Waist circumference	90 (83, 98)	91 (82, 95)	0.537
Duration from symptom onset to the last follow-up, months	18.4 (18.1, 19.0)	18.6 (18.3, 19.3)	0.010

77 Continuous variables were expressed as median (interquartile range) and compared with the
78 Mann-Whitney U test. Categorical variables were expressed as frequency (percentage) and
79 compared with χ^2 test or Fisher's Exact test.

111 Data were expressed as median (interquartile range) or frequency (percentage). Kruskal-Wallis test was applied for group comparisons of
112 continuous variables, and χ^2 test or Fisher Exact tests were performed to analyze the categorical variables. CT: computed tomography; FEV₁:
113 forced expiratory volume in one second; FVC: forced vital capacity; FEF₂₅₋₇₅: forced expiratory flow between 25% and 75% of vital capacity;
114 GGO, ground-glass opacity; RP, reticular pattern; hsTnT, highly-sensitive troponin T; NT₅₀, the half-maximal inhibitory concentration; NAb,
115 neutralizing antibody. ^a Significant difference between visit 1 and visit 2 groups ($P < 0.05$). ^b Significant difference between visit 1 and visit 3
116 groups ($P < 0.05$). ^c Significant difference between visit 2 and visit 3 groups ($P < 0.05$).

eTable 8. Basic characteristics of participants who were included and excluded.

Variables	Included population (N=208)	Excluded population (N=81)	P value
Age, years	58.0 (50.0, 64.3)	60.0 (52.0, 66.0)	0.236
Gender, n (%)			0.698
Male	100 (48.1)	41 (50.6)	
Female	108 (51.9)	40 (49.4)	
Education, n (%)			0.616
Middle school or lower	140 (67.3)	57 (70.4)	
College or higher	68 (32.7)	24 (29.6)	
Household income, n (%)			0.209
< 50000 RMB/year	107 (51.4)	35 (43.2)	
≥ 50000 RMB/year	101 (48.6)	46 (56.8)	
Cigarette smoking, n (%)			0.607
Never-smoker	183 (88.0)	73 (90.1)	
Ever-smoker	25 (12.0)	8 (9.9)	
Alcohol consumption, n (%)			0.523
Never-drinker	183 (88.0)	69 (85.2)	
Ever-drinker	25 (12.0)	12 (14.8)	
Comorbidity, n (%)			
Hypertension	75 (36.1)	32 (39.5)	0.586
Diabetes	23 (11.1)	12 (14.8)	0.379
CVD	14 (6.7)	6 (7.4)	0.839
Body mass index	24.3 (22.6, 26.5)	24.0 (22.4, 25.9)	0.341
Waist circumference	90 (83, 97)	91.0 (83.0, 96.0)	0.924
Duration from symptom onset to the last follow-up, months	18.5 (18.2, 19.1)	-	-

118 Continuous variables were expressed as median (interquartile range) and compared with the
119 Mann-Whitney U test. Categorical variables were expressed as frequency (percentage) and
120 compared with χ^2 test or Fisher's Exact test.
