**Table S1 | Presence of highly similar compounds in commercially available libraries.** For each library, the number of molecules having *at least* one highly similar neighbor (determined as having a Tanimoto similarity on ECFPs larger than 90%) was reported, along with the corresponding percentage. ECFPs (1024 bits, radius = 2) were computed with RDKit on canonical SMILES strings, after filtering out duplicates and salts, within KNIME 4.3.3.

| Provider and library                      | no. molecules | no. similar | perc. similar |
|---|---------------|-------------|---------------|
| <i>Asinex</i> <sup>a</sup>                | 572,393       | 76,794      | 13.42%        |
| <i>Specs</i> (10, 20, 50 mg) <sup>b</sup> | 199,965       | 13,369      | 6.69%         |

## Supporting Information

**Table S2 | Dataset overview**, with receptor class, ChEMBL ID, response type (inhibition [ $K_i$ ] or agonism [ $EC_{50}$ ]), number of compounds in the train and test set, along with the number of activity cliff compounds in the train and test set.

| Target name (ID)  | Receptor Class | ChEMBL ID  | Type      | n train/test | n cliff train/test |
|---|----------------|------------|-----------|--------------|--------------------|
| Androgen Receptor (AR)  | NR             | CHEMBL1871 | $K_i$     | 525/134      | 126/31             |
| Cannabinoid receptor 1 (CB1)                                      | GPCR           | CHEMBL218  | $EC_{50}$ | 823/208      | 292/75             |
| Coagulation factor X (FX)   | Protease       | CHEMBL244  | $K_i$     | 2476/621     | 1080/270           |
| Delta opioid receptor (DOR)                                       | GPCR           | CHEMBL236  | $K_i$     | 2077/521     | 772/193            |
| Dopamine D3 receptor (D3R)  | GPCR           | CHEMBL234  | $K_i$     | 2923/734     | 1150/291           |
| Dopamine D4 receptor (D4R)  | GPCR           | CHEMBL219  | $K_i$     | 1485/374     | 572/143            |
| Dopamine transporter (DAT)  | Other          | CHEMBL238  | $K_i$     | 839/213      | 209/54             |
| Dual specificity protein kinase CLK4                              | Kinase         | CHEMBL4203 | $K_i$     | 582/149      | 51/13              |
| Farnesoid X receptor (FXR)  | NR             | CHEMBL2047 | $EC_{50}$ | 503/128      | 195/50             |
| Ghrelin receptor (GHSR)   | GPCR           | CHEMBL4616 | $EC_{50}$ | 543/139      | 262/68             |
| Glucocorticoid receptor (GR)                                      | NR             | CHEMBL2034 | $K_i$     | 598/152      | 183/47             |
| Glycogen synthase kinase-3 beta (GSK3)                            | Kinase         | CHEMBL262  | $K_i$     | 683/173      | 127/31             |
| Histamine H1 receptor (HRH1)                                      | GPCR           | CHEMBL231  | $K_i$     | 776/197      | 178/46             |
| Histamine H3 receptor (HRH3)                                      | GPCR           | CHEMBL264  | $K_i$     | 2288/574     | 865/219            |
| Janus kinase 1 (JAK1)   | Kinase         | CHEMBL2835 | $K_i$     | 489/126      | 36/10              |
| Janus kinase 2 (JAK2)   | Kinase         | CHEMBL2971 | $K_i$     | 779/197      | 95/25              |
| Kappa opioid receptor (KOR) agonism                               | GPCR           | CHEMBL237  | $EC_{50}$ | 762/193      | 319/81             |
| Kappa opioid receptor (KOR) inhibition                            | GPCR           | CHEMBL237  | $K_i$     | 2081/521     | 753/188            |

## Supporting Information

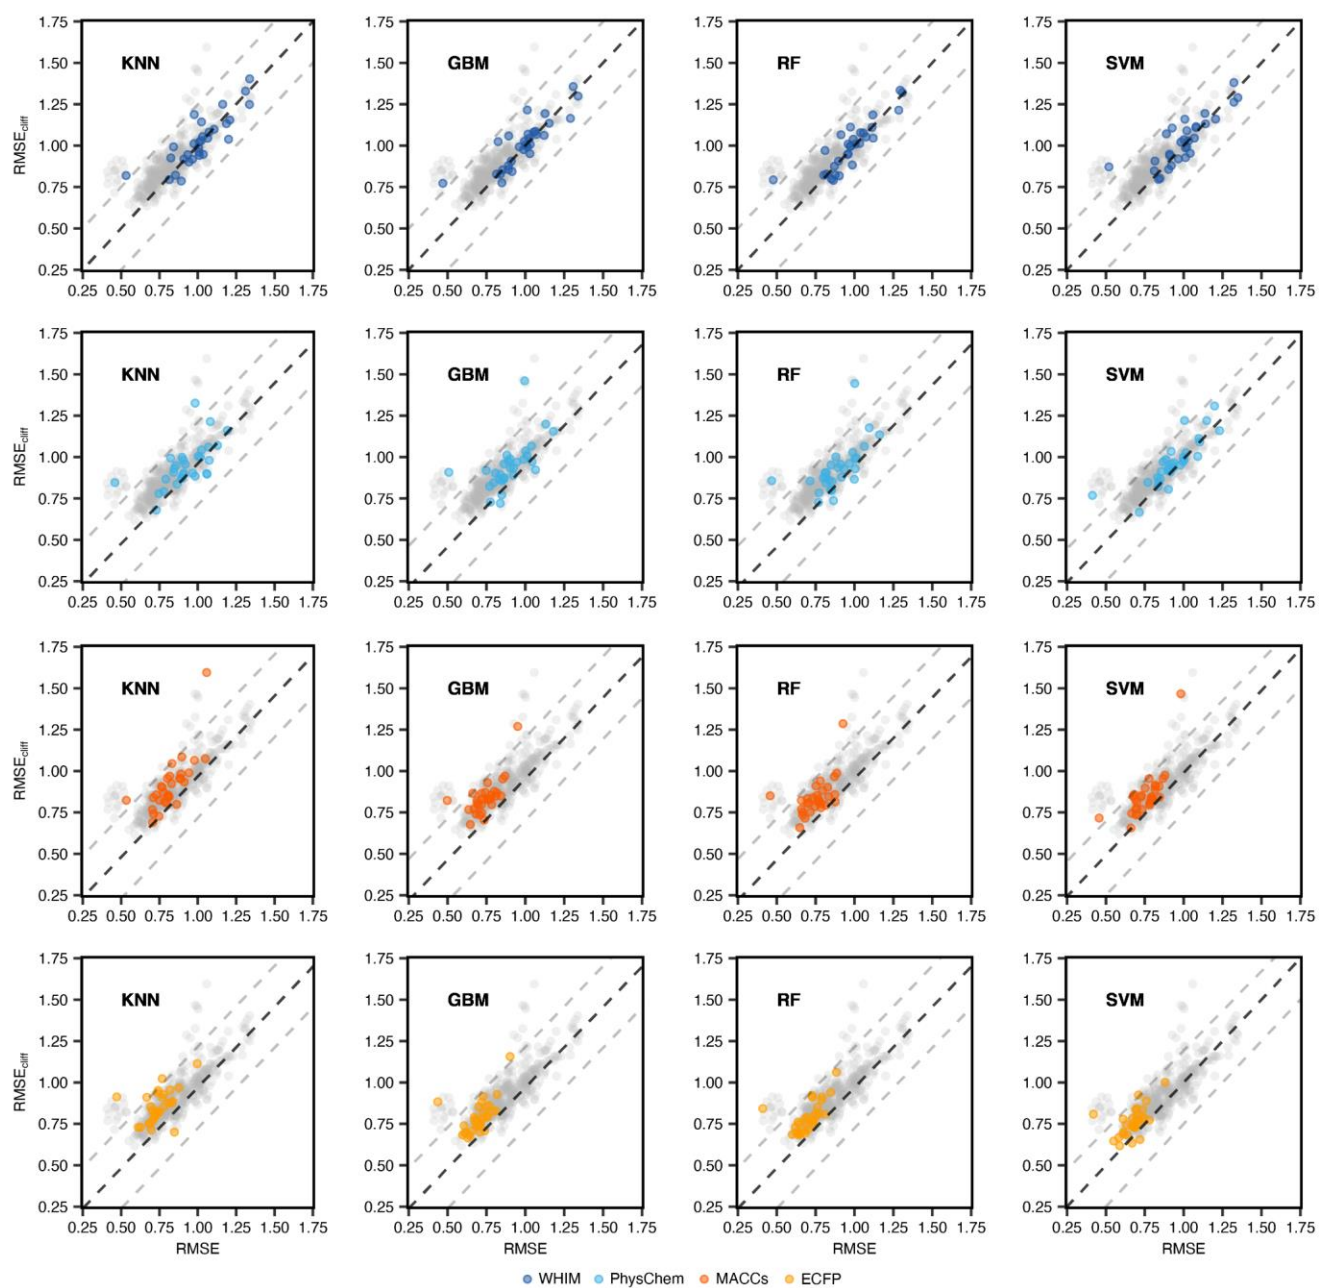

**Fig. S1 | Overall performance of machine learning methods on all targets.** **a**, RMSE using different traditional machine learning algorithms and molecular descriptors. **b**, RMSE using deep learning methods and unstructured molecular representations.

**Fig. S2 | PCA loadings of all methods.** **a**, Effects of individual data sets (loadings for PC1 and PC2) on the PCA of traditional machine learning methods (see Fig. 3b). **b**, Effects of individual data sets (loadings for PC1 and PC2) on the PCA of deep learning methods (see Fig. 4b).

## Supporting Information

**Fig. S3 | Relative prediction error of activity cliff compounds.** Prediction error on activity cliff compounds compared to all compounds for all traditional machine learning algorithms and molecular descriptor combinations.

# Supporting Information

**Fig. S4 | Statistical differences between the  $RMSE_{cliff}$  values obtained by different machine learning strategies.** Asterisks indicate statistically significant differences ( $p < 0.05$ ) between pairs of methods, as obtained by the Wilcoxon rank-sum test (adjusted for false discovery rate using a Benjamini-Hochberg procedure).

**Fig. S5 | Relationship between the number of training molecules on  $RMSE_{cliff}$ .** Error bars indicate the lowest and highest  $RMSE_{cliff}$ .

## Supporting Information

**Fig. S6 | Relationship between the fraction of activity cliff compounds and model performance.** **a.** Overall model performance (RMSE). Pearson correlation ( $r$ ) = 0.21. **b.** Performance on activity cliff compounds (RMSE<sub>cliff</sub>,  $r$  = -0.12). **c.** Difference between RMSE<sub>cliff</sub> and RMSE ( $r$  = -0.54). Error bars indicate the lowest and highest RMSEs.

**Fig. S7 | Relationship between drug target classes and RMSE<sub>cliff</sub>.** All machine learning strategies are grouped by molecular descriptor/representation.
