

# The Journal of Physiology Statistical Summary Document

**Manuscript Title:** ATP-sensitive potassium channels in zebrafish cardiac and vascular smooth muscle

**Authors:** Soma S. Singareddy, Helen I. Roessler, Conor McClenaghan, Jen Ikle, Rob Tryon, Gijs van Haaften and Colin G. Nichols

**Animal model used, if applicable:** Zebrafish - WT and transgenic (Multiple knockout/knockin mutants of Abcc8, Abcc9, Kcnj8 and Kcnj11) on AB/Tuebingen background.

**Underlying hypothesis:** This investigation tests the make-up of ATP-sensitive potassium (KATP) channels in zebrafish cardiac, and vascular smooth muscle. We test the hypothesis that subunits specified by the two Abcc8 and Abcc9 genes, as well as the Kcnj8 and Kcnj9 genes are differentially expressed and have different roles generating KATP channels in these tissues. In addition we test the hypothesis that nucleotide sensitivity of the channels is different between WT and mutant channels.

## Definitions of 'n':

Question 1: n = individual patches, each from a different cell, recorded from at least 3 fish of the specified genotype (WT, Kv3.1KO or Kv3.3KO), unless noted.

## Statistical summary table:

Experimental question	Finding	Location	Mean value	SD	n	p**	Data comparisons	Statistical test	Other variable	Figure	
Different K1/2 than WT	ACM less sensitive to ATP than WT	ACM	35.15	1.60	3	0.01	ACM vs VCM	Kruskal-Wallis Test	-Mg	2B	
		VCM	18.07	1.14	5				-Mg		
		ACM	37.04	4.31	7	0.01			+Mg		
		VCM	20.44	2.62	6				+Mg
